This Water Quality Management Plan (WQMP) has been prepared for Kingsbarn Realty Capital by Fuscoe Engineering, Inc. The WQMP is intended to comply with the requirements of the County of Orange NPDES Stormwater Program requiring the preparation of the plan.

The undersigned, while it owns the subject property, is responsible for the implementation of the provisions of this plan, including the ongoing operation and maintenance of all best management practices (BMPs), and will ensure that this plan is amended as appropriate to reflect up-to-date conditions on the site consistent with the current Orange County Drainage Area Management Plan (DAMP) and the intent of the non-point source NPDES Permit for Waste Discharge Requirements for the County of Orange, Orange County Flood Control District and the incorporated Cities of Orange County within the Santa Ana Region. Once the undersigned transfers its interest in the property, its successors-in-interest shall bear the aforementioned responsibility to implement and amend the WQMP. An appropriate number of approved and signed copies of this document shall be available on the subject site in perpetuity.

**Priority Project Water Quality Management Plan (WQMP)**  
**Terraviva**

## Section II Project Description

### II.1 Project Description

Provide a detailed project description including:

- Project areas;
- Land uses;
- Land cover;
- Design elements;

A general description not broken down by drainage management areas (DMAs).

Include attributes relevant to determining applicable source controls. Refer to Section 2.2 in the Technical Guidance Document (TGD) for information that must be included in the project description.

| Description of Proposed Project                                    |   |            |                          |            |
|--|---|------------|--------------------------|------------|
| Development Category<br>(From Model WQMP,<br>Table 7.11-2; or -3): | 8. All significant redevelopment projects, where significant redevelopment is defined as the addition of 5,000 or more square feet of impervious surface on an already developed site, and the existing development or redevelopment falls under another Priority Project Category.   |            |                          |            |
| Project Area (ft <sup>2</sup> ): 695,728                           | Number of Dwelling Units: 480   |            | SIC Code: N/A            |            |
| Project Area   | Pervious  |            | Impervious               |            |
|  | Area<br>(acres or sq ft)  | Percentage | Area<br>(acres or sq ft) | Percentage |
| Pre-Project Conditions   | 6.15 ac   | 39%        | 9.82 ac                  | 61%        |
| Post-Project Conditions  | 4.31 ac   | 26%        | 11.66 ac                 | 73%        |
| Drainage Patterns/<br>Connections                                  | The existing project site is currently a commercial building and parking lot and surface drains through a series of v-gutters down the drive entrance on onto Mill Creek Drive and Ridge Route Drive and into the existing 48" diameter storm drain in Ridge Route Drive, ultimately discharging into Veeh Reservoir. The existing slope along the northern property line drains north to Veeh Reservoir. |            |                          |            |

|  |   |
|--|---|
|  | <p>The project will maintain existing drainage patterns to the maximum extent practical. The onsite drainage identified as series 100 in the drainage study is divided into flow originating from the multistory area and flow originating around the single-family residential area. It is composed of concentrated flow moving towards the south through the proposed storm drain pipeline system. Onsite storm water runoff from both areas is detained in a proprietary underground storage system with the purpose of reaching 100-year peak flow attenuation. This runoff is then conveyed to a proprietary treatment control BMP system that leads to a proposed 24-inch storm drain main joined to an existing 48-inch RCP storm drain main in Ridge Route Dr, ultimately draining north into the Veeh Reservoir.</p> <p>Offsite drainage on Mill Creek Drive will continue to convey into the storm drain inlet at Node 111 of the Existing Hydrology Map where it eventually leads to the Veeh Reservoir. Offset drainage on Ridge Route Drive will continue to move along the northern side of the street into the type II storm drain catch basin. This flow will advance north via the existing 48-inch RCP storm drain main into the Veeh Reservoir.</p> <p>The runoff at the asphalt parking lot on the western section and the residential's gate entrance area will be carried across the northeastern curb and gutter of Mill Creek Dr into the existing storm drain inlet and joins the rest of the offsite flow that reaches Node 111 from the Existing Hydrology Map into the Veeh Reservoir.</p> <p>The 200 Node series area (existing slope along the northern property boundary) is reduced compared to existing conditions due to the construction of duplexes on the northeastern side and is comprised of sheet flow that is led into the Veeh Reservoir.</p> <p>The project will not result in increased 100-yr peak flow rates in the proposed condition after mitigation of the 100-year runoff. See the drainage study for more details.</p> |
| <p>Narrative Project Description:<br/>         (Use as much space as necessary.)</p> | <p>The proposed residential development will consist of 480 dwelling units, approximately 700,000 SF of a combination of a multifamily residential building, multiple duplexes and triplexes, and associated amenity spaces such as parks and lounges. Some existing driveways will be removed, and new asphalt driveways will be added to existing access roads on Mill Creek Drive and Ridge Route Drive. New improvements in the area and its frontage include the addition of public storm drain, water, &amp; sewer utilities.</p>   |

There are no vehicle maintenance or cleaning areas, no delivery areas, loading docks, or fueling areas. The proposed landscaping is a variety of turf, shrubs, and trees typical of a residential development. There will be no proposed slopes and no new run-on or additional run-off from the site. No environmentally sensitive features are proposed or altered. No off-site drainage is anticipated.

**II.2 Potential Stormwater Pollutants**

Determine and list expected stormwater pollutants based on land uses and site activities. Refer to Section 2.2.2 and Table 2.1 in the Technical Guidance Document (TGD) for guidance.

| Pollutants of Concern      |   |                                       |                                     |
|----------------------------|---|---------------------------------------|-------------------------------------|
| Pollutant                  | Check One for each:<br>E=Expected to be of concern<br>N=Not Expected to be of concern |                                       | Additional Information and Comments |
| Suspended-Solid/ Sediment  | E <input checked="" type="checkbox"/>   | N <input type="checkbox"/>            |                                     |
| Nutrients                  | E <input checked="" type="checkbox"/>   | N <input type="checkbox"/>            |                                     |
| Heavy Metals               | E <input type="checkbox"/>  | N <input checked="" type="checkbox"/> | Not applicable.                     |
| Pathogens (Bacteria/Virus) | E <input checked="" type="checkbox"/>   | N <input type="checkbox"/>            |                                     |
| Pesticides                 | E <input checked="" type="checkbox"/>   | N <input type="checkbox"/>            |                                     |
| Oil and Grease             | E <input checked="" type="checkbox"/>   | N <input type="checkbox"/>            |                                     |
| Toxic Organic Compounds    | E <input type="checkbox"/>  | N <input checked="" type="checkbox"/> | Not applicable.                     |
| Trash and Debris           | E <input checked="" type="checkbox"/>   | N <input type="checkbox"/>            |                                     |

### II.3 Hydrologic Conditions of Concern

Determine if streams located downstream from the project area are potentially susceptible to hydromodification impacts. Refer to Section 2.2.3.1 in the Technical Guidance Document (TGD) for North Orange County or Section 2.2.3.2 for South Orange County.

No – Show map

Yes – Describe applicable hydrologic conditions of concern below. Refer to Section 2.2.3 in the Technical Guidance Document (TGD).

*Although the project is susceptible to hydromodification impacts, the proposed conditions increase the time of concentration and increases the peak runoff and volume by the allowable thresholds of 110% and 105%, respectively. Therefore, additional mitigation measures are not required. See the table below and Attachment D for additional information.*

| 2-YEAR, 24-HOUR STORM SUMMARY |           |              |                   |                |
|-------------------------------|-----------|--------------|-------------------|----------------|
| Condition                     | Area (ac) | Tc (min)     | Peak Runoff (cfs) | Volume (ac-ft) |
| Pre-development               | 15.97     | 8.49         | 24.71             | 1.80           |
| Post-development              | 15.97     | 8.71         | 25.08             | 1.88           |
| <b>Difference</b>             | ---       | <b>0.22</b>  | <b>0.37</b>       | <b>0.08</b>    |
| <b>% Change</b>               |           | <b>2.61%</b> | <b>1.50%</b>      | <b>4.44%</b>   |

### II.4 Post-Development Drainage Characteristics

Describe post development drainage characteristics. Refer to Section 2.2.4 in the Technical Guidance Document (TGD).

The project will maintain existing drainage patterns to the maximum extent practical. As in existing conditions, stormwater runoff from the proposed development will ultimately discharge to the Veeh Reservoir located northeast of the property boundary.

The onsite drainage identified as series 100 in the drainage study is divided into flow originating from the multistory area and flow originating around the single-family residential area. It is composed of concentrated flow moving towards the south through the proposed storm drain pipeline system. Onsite storm water runoff from both areas is detained in a proprietary underground storage system with the purpose of reaching 100-year peak flow attenuation. This runoff is then conveyed to a proprietary treatment control BMP system that leads to a proposed 24-inch storm drain main joined to an existing 48-inch RCP storm drain main in Ridge Route Dr, ultimately draining north into the Veeh Reservoir.

Offsite drainage on Mill Creek Drive will continue to convey into the storm drain inlet at Node 111 of the Existing Hydrology Map where it eventually leads to the Veeh Reservoir.

Offset drainage on Ridge Route Drive will continue to move along the northern side of the street into the type II storm drain catch basin. This flow will advance north via the existing 48-inch RCP storm drain main into the Veeh Reservoir.

The runoff at the asphalt parking lot on the western section and the residential's gate entrance area will be carried across the northeastern curb and gutter of Mill Creek Dr into the existing storm drain inlet and joins the rest of the offsite flow that reaches Node 111 from the Existing Hydrology Map into the Veeh Reservoir.

The 200 Node series area (existing slope along the northern property boundary) is reduced compared to existing conditions due to the construction of duplexes on the northeastern side and is comprised of sheet flow that is led into the Veeh Reservoir.

The project will not result in increased 100-yr peak flow rates in the proposed condition after mitigation of the 100-year runoff. See the drainage study for more details.

## **II.5 Property Ownership/Management**

Describe property ownership/management. *Refer to Section 2.2.5 in the Technical Guidance Document (TGD).*

On-site proposed drainage facilities will be privately owned and maintained.

## **Section III Site Description**

### **III.1 Physical Setting**

Fill out table with relevant information. *Refer to Section 2.3.1 in the Technical Guidance Document (TGD).*

|   |   |
|---|---|
| Name of Planned Community/Planning Area (if applicable) | N/A   |
| Location/ Address                                       | 23282 Mill Creek Dr, Laguna Hills, CA 92653 |
| General Plan Land Use Designation                       | Mixed Use                                   |
| Zoning  | Mixed Use                                   |
| Acreage of Project Site                                 | 15.97                                       |
| Predominant Soil Type                                   | D   |

### **III.2 Site Characteristics**

Fill out table with relevant information and include information regarding BMP sizing, suitability, and feasibility, as applicable. *Refer to Section 2.3.2 in the Technical Guidance Document (TGD).*

| <b>Site Characteristics</b>                     |   |
|---|---|
| Precipitation Zone                              | 0.80 in   |
| Topography                                      | The site is graded generally easterly, with an average slope of 2%. The site has an elevation difference of approximately 50-60 ft. |
| Drainage Patterns/Connections                   | See Section II.1 and Section II.4 for a complete description of existing and proposed drainage patterns and connections.            |
| Soil Type, Geology, and Infiltration Properties | Hydrologic Soil Type D underlays the site according to the Caltrans Water Quality Planning Tool.                                    |

|  |  |
|--|--|
| Hydrogeologic (Groundwater) Conditions             | According to the site-specific geotechnical report, groundwater was not encountered within 31 feet below ground surface. The reservoir adjacent to the site has a historical groundwater at 10 feet below the existing ground surface, according to the CGS Seismic Hazard Zone Report, San Juan Capistrano Quadrangle (2001). |
| Geotechnical Conditions (relevant to infiltration) | Two percolation tests were performed, with infiltration rates of 0.0 in/hr and 0.2 in/hr. Due to low infiltration rates, infiltration is deemed infeasible for the site.   |
| Off-Site Drainage                                  | No off-site drainage is anticipated.   |
| Utility and Infrastructure Information             | Dry and wet utilities will be incorporated into the proposed project and will tie into existing facilities associated with the existing development.   |

### III.3 Watershed Description

Fill out table with relevant information and include information regarding BMP sizing, suitability, and feasibility, as applicable. Refer to Section 2.3.3 in the Technical Guidance Document (TGD).

|  |   |
|--|---|
| Receiving Waters   | San Diego Creek Reach 1, Newport Bay, Pacific Ocean   |
| 303(d) Listed Impairments  | Benthic Community Effects, Chlordane, Copper, DDT, Indicator Bacteria, Malathion, Nutrients, PCBs, Sedimentation/Siltation, Selenium, Toxaphene, Toxicity |
| Applicable TMDLs   | Sediment, Nutrients, Toxics, Fecal Coliform   |
| Pollutants of Concern for the Project                              | Suspended Solids, Nutrients, Bacteria/Pathogens, Pesticides, Oil and Grease, Trash and Debris   |
| Environmentally Sensitive and Special Biological Significant Areas | N/A   |

## Section IV Best Management Practices (BMPs)

### IV.1 Project Performance Criteria

Describe project performance criteria. Several steps must be followed in order to determine what performance criteria will apply to a project. These steps include:

- If the project has an approved WIHMP or equivalent, then any watershed specific criteria must be used and the project can evaluate participation in the approved regional or sub-regional opportunities. (Please ask your assigned planner or plan checker regarding whether your project is part of an approved WIHMP or equivalent.)
- Determine applicable hydromodification control performance criteria. *Refer to Section 7.II-2.4.2.2 of the Model WQMP.*
- Determine applicable LID performance criteria. *Refer to Section 7.II-2.4.3 of the Model WQMP.*
- Determine applicable treatment control BMP performance criteria. *Refer to Section 7.II-3.2.2 of the Model WQMP.*
- Calculate the LID design storm capture volume for the project. *Refer to Section 7.II-2.4.3 of the Model WQMP.*

|  |                              |  |
|--|------------------------------|--|
| NOC Permit Area only) Is there an approved WIHMP or equivalent for the project area that includes more stringent LID feasibility criteria or if there are opportunities identified for implementing LID on regional or sub-regional basis? | YES <input type="checkbox"/> | NO <input checked="" type="checkbox"/> |
| If yes, describe WIHMP feasibility criteria or regional/sub-regional LID opportunities.  |                              |  |

| <b>Project Performance Criteria</b>  |  |
|--|--|
| If HCOC exists, list applicable hydromodification control performance criteria (Section 7.II-2.4.2.2 in MWQMP) | If a hydrologic condition of concern (HCOC) exists, priority projects shall implement onsite or regional hydromodification controls such that: <ul style="list-style-type: none"> <li>• Post-development runoff volume for the two-year frequency storm does not exceed that of the predevelopment condition by more than five percent, and</li> </ul> |

|  |  |
|--|--|
|  | <ul style="list-style-type: none"> <li>Time of concentration of post-development runoff for the two-year storm event is not less than that for the predevelopment condition by more than five percent.</li> </ul>  |
| List applicable LID performance criteria (Section 7.II-2.4.3 from MWQMP)                   | <p>Infiltrate, harvest and use, evapotranspire, or biotreat/biofilter, the 85th percentile, 24-hour storm event (Design Capture Volume).</p> <p>LID BMPs must be designed to retain, on-site, (infiltrate, harvest and use, or evapotranspire) storm water runoff up to 80 percent average annual capture efficiency.</p>  |
| List applicable treatment control BMP performance criteria (Section 7.II-3.2.2 from MWQMP) | <p>If it is not feasible to meet LID performance criteria through retention and/or biotreatment provided on-site or at a sub-regional/regional scale, then treatment control BMPs shall be provided on-site or offsite prior to discharge to waters of the US. Sizing of treatment control BMP(s) shall be based on either the unmet volume after claiming applicable water quality credits, if appropriate.</p> |
| Calculate LID design storm capture volume for Project.                                     | $DCV = (0.75 \times 0.73 + 0.15) \times 0.80 \text{ in} \times 15.97 \text{ ac} \times 43560 \text{ sf/ac} \times 1/12 \text{ in/ft} = 32,348 \text{ cu-ft}$   |

## IV.2. Site Design and Drainage

Describe site design and drainage including

- A narrative of site design practices utilized or rationale for not using practices;
- A narrative of how site is designed to allow BMPs to be incorporated to the MEP
- A table of DMA characteristics and list of LID BMPs proposed in each DMA.
- Reference to the WQMP "BMP Exhibit."
- Calculation of Design Capture Volume (DCV) for each drainage area.
- A listing of GIS coordinates for LID and Treatment Control BMPs.

Refer to Section 2.4.2 in the Technical Guidance Document (TGD).

HSCs are used throughout the project for runoff dispersion in the form of impervious area dispersion and disconnected roof downspouts. DMA 2 includes of a portion of the site frontage along Ridge Route Drive which drains directly onto Ridge Route Drive. DMA 3 includes of a portion of the site frontage along Mill Creek Drive which drains directly onto Mill Creek Drive. DMA 4 includes a portion of the site is an existing vegetative slope which drains directly into Veeh Reservoir. DMAs 2 through 4 consist of vegetative slopes and insignificant portions of site access walkways.

DMA 1 is a combination of residential buildings, streets, walkways, and residential landscaping. Due to the site sizing constraint and lack of natural infiltration, a proprietary

BMP biotreatment Modular Wetland System (MWS) planter box is proposed. See worksheets and calculations in Attachment A.

| <b>Drainage Management Area (DMA) Summary</b> |   |                 |                        |                          |
|---|---|-----------------|------------------------|--------------------------|
| DMA   | Drainage Area<br>(ac or ft <sup>2</sup> ) | %<br>Impervious | DCV (ft <sup>3</sup> ) | BMP                      |
| 1   | 14.99                                     | 75              | 30,914                 | Proprietary Biotreatment |
| 2   | 0.42                                      | 0               | 182                    | HSC-2                    |
| 3   | 0.24                                      | 58              | 419                    | HSC-2                    |
| 4   | 0.32                                      | 76              | 659                    | HSC-2                    |

Refer to Section VI for locations of each DMA and BMP proposed for the project.

### **IV.3 LID BMP Selection and Project Conformance Analysis**

Each sub-section below documents that the proposed design features conform to the applicable project performance criteria via check boxes, tables, calculations, narratives, and/or references to worksheets. *Refer to Section 2.4.2.3 in the Technical Guidance Document (TGD) for selecting LID BMPs and Section 2.4.3 in the Technical Guidance Document (TGD) for conducting conformance analysis with project performance criteria.*

#### **IV.3.1 Hydrologic Source Controls (HSCs)**

If required HSCs are included, fill out applicable check box forms. If the retention criteria are otherwise met with other LID BMPs, include a statement indicating HSCs not required.

| <b>Name</b>  | <b>Included?</b>                    |
|--|-------------------------------------|
| Localized on-lot infiltration                            | <input type="checkbox"/>            |
| Impervious area dispersion (e.g. roof top disconnection) | <input checked="" type="checkbox"/> |
| Street trees (canopy interception)                       | <input type="checkbox"/>            |
| Residential rain barrels (not actively managed)          | <input type="checkbox"/>            |
| Green roofs/Brown roofs                                  | <input type="checkbox"/>            |
| Blue roofs   | <input type="checkbox"/>            |

|  |                          |
|--|--------------------------|
| Impervious area reduction (e.g. permeable pavers, site design) | <input type="checkbox"/> |
| Other:   | <input type="checkbox"/> |
| Other:   | <input type="checkbox"/> |
| Other:   | <input type="checkbox"/> |

HSCs are used throughout the project for runoff dispersion in the form of impervious area dispersion and disconnected roof downspouts. DMA 2 includes of a portion of the site frontage along Ridge Route Drive which drains directly onto Ridge Route Drive. DMA 3 includes of a portion of the site frontage along Mill Creek Drive which drains directly onto Mill Creek Drive. DMA 4 includes a portion of the site is an existing vegetative slope which drains directly into Veeh Reservoir. DMAs 2 through 4 consist of vegetative slopes and insignificant portions of site access walkways.

**IV.3.2 Infiltration BMPs**

Identify infiltration BMPs to be used in project. If design volume cannot be met, state why.

| <b>Name</b>                       | <b>Included?</b>         |
|-----------------------------------|--------------------------|
| Bioretention without underdrains  | <input type="checkbox"/> |
| Rain gardens                      | <input type="checkbox"/> |
| Porous landscaping                | <input type="checkbox"/> |
| Infiltration planters             | <input type="checkbox"/> |
| Retention swales                  | <input type="checkbox"/> |
| Infiltration trenches             | <input type="checkbox"/> |
| Infiltration basins               | <input type="checkbox"/> |
| Drywells                          | <input type="checkbox"/> |
| Subsurface infiltration galleries | <input type="checkbox"/> |
| French drains                     | <input type="checkbox"/> |
| Permeable asphalt                 | <input type="checkbox"/> |
| Permeable concrete                | <input type="checkbox"/> |
| Permeable concrete pavers         | <input type="checkbox"/> |
| Other:                            | <input type="checkbox"/> |
| Other:                            | <input type="checkbox"/> |

Show calculations below to demonstrate if the LID Design Storm Capture Volume can be met with infiltration BMPs. If not, document how much can be met with infiltration and document why it is not feasible to meet the full volume with infiltration BMPs.

Based on the low infiltration rates, infiltration was deemed infeasible for the site.

**IV.3.3 Evapotranspiration, Rainwater Harvesting BMPs**

If the full Design Storm Capture Volume cannot be met with infiltration BMPs, describe any evapotranspiration and/or rainwater harvesting BMPs included.

| Name                                | Included?                |
|-------------------------------------|--------------------------|
| All HSCs; <i>See Section IV.3.1</i> | <input type="checkbox"/> |
| Surface-based infiltration BMPs     | <input type="checkbox"/> |
| Biotreatment BMPs                   | <input type="checkbox"/> |
| Above-ground cisterns and basins    | <input type="checkbox"/> |
| Underground detention               | <input type="checkbox"/> |
| Other:                              | <input type="checkbox"/> |
| Other:                              | <input type="checkbox"/> |

Show calculations below to demonstrate if the LID Design Storm Capture Volume can be met with evapotranspiration and/or rainwater harvesting BMPs in combination with infiltration BMPs. If not, document below how much can be met with either infiltration BMPs, evapotranspiration, rainwater harvesting BMPs, or a combination, and document why it is not feasible to meet the full volume with these BMP categories

For a system to be considered “feasible”, the system must be designed with a storage volume equal to the DCV from the tributary area and achieve more than 40% capture. The system must also be able to drawdown in 30 days to meet the 40% capture value. This is determined by calculating the Estimated Applied Water Use (EAWU) equation from Appendix X of the TGD. The EAWU can then be divided by the water quality volume for the project site or DMA to determine drawdown time. If the drawdown time is less than 30 days, harvest and reuse is considered partially feasible and the Effective Irrigated Area to Tributary Area (EIATA) ratio may be utilized to determine the capture efficiency of the system. If drawdown is greater than 30 days, harvest and reuse may be concluded to be infeasible.

As shown by Worksheet J included in Appendix A, harvest and reuse is considered infeasible due insufficient water demand during the wet season to drawdown the water quality volume.

### IV.3.4 Biotreatment BMPs

If the full Design Storm Capture Volume cannot be met with infiltration BMPs, and/or evapotranspiration and rainwater harvesting BMPs, describe biotreatment BMPs included. Include sections for selection, suitability, sizing, and infeasibility, as applicable.

| Name                                       | Included?                           |
|--|-------------------------------------|
| Bioretention with underdrains              | <input type="checkbox"/>            |
| Stormwater planter boxes with underdrains  | <input type="checkbox"/>            |
| Rain gardens with underdrains              | <input type="checkbox"/>            |
| Constructed wetlands                       | <input type="checkbox"/>            |
| Vegetated swales                           | <input type="checkbox"/>            |
| Vegetated filter strips                    | <input type="checkbox"/>            |
| Proprietary vegetated biotreatment systems | <input checked="" type="checkbox"/> |
| Wet extended detention basin               | <input type="checkbox"/>            |
| Dry extended detention basins              | <input type="checkbox"/>            |
| Other:                                     | <input type="checkbox"/>            |
| Other:                                     | <input type="checkbox"/>            |

Show calculations below to demonstrate if the LID Design Storm Capture Volume can be met with infiltration, evapotranspiration, rainwater harvesting and/or biotreatment BMPs. If not, document how much can be met with either infiltration BMPs, evapotranspiration, rainwater harvesting BMPs, or a combination, and document why it is not feasible to meet the full volume with these BMP categories.

DMA 1 is a combination of residential buildings, streets, walkways, and residential landscaping. Due to the site sizing constraint and lack of natural infiltration, a proprietary BMP biotreatment Modular Wetland System (MWS) planter box is proposed. See worksheets and calculations in Attachment A.

| BIOTREATMENT SUMMARY |                         |       |          |                   |                           |                |                    |
|----------------------|-------------------------|-------|----------|-------------------|---------------------------|----------------|--------------------|
| DMA                  | Area (ft <sup>2</sup> ) | % Imp | Tc (min) | Intensity (in/hr) | Q <sub>Design</sub> (cfs) | BMP Model      | BMP Capacity (cfs) |
| 1                    | 653,119                 | 75    | 5        | 0.26              | 2.77                      | (5) MWS-L-8-20 | 2.90               |

### IV.3.5 Hydromodification Control BMPs

Describe hydromodification control BMPs. See Section 5 of the Technical Guidance Document (TGD). Include sections for selection, suitability, sizing, and infeasibility, as applicable. Detail compliance with Prior Conditions of Approval (if applicable).

| Hydromodification Control BMPs |                 |
|--------------------------------|-----------------|
| BMP Name                       | BMP Description |
| N/A                            | N/A             |

Although the project is susceptible to hydromodification impacts, the proposed conditions increase the time of concentration and increases the peak runoff and volume by the allowable thresholds of 110% and 105%, respectively. Therefore, additional mitigation measures are not required. See Section II.3 and Attachment D for additional information.

### IV.3.6 Regional/Sub-Regional LID BMPs

Describe regional/sub-regional LID BMPs in which the project will participate. *Refer to Section 7.II-2.4.3.2 of the Model WQMP.*

| Regional/Sub-Regional LID BMPs |
|--------------------------------|
| Not Applicable.                |

### IV.3.7 Treatment Control BMPs

Treatment control BMPs can only be considered if the project conformance analysis indicates that it is not feasible to retain the full design capture volume with LID BMPs. Describe treatment control BMPs including sections for selection, sizing, and infeasibility, as applicable.

| Treatment Control BMPs |                 |
|------------------------|-----------------|
| BMP Name               | BMP Description |
| N/A                    | N/A             |

**IV.3.8 Non-structural Source Control BMPs**

Fill out non-structural source control check box forms or provide a brief narrative explaining if non-structural source controls were not used.

| <b>Non-Structural Source Control BMPs</b> |   |                                     |                                     |  |
|---|---|-------------------------------------|-------------------------------------|--|
| <b>Identifier</b>                         | <b>Name</b>   | <b>Check One</b>                    |                                     | <b>If not applicable, state brief reason</b> |
|   |   | <b>Included</b>                     | <b>Not Applicable</b>               |  |
| N1  | Education for Property Owners, Tenants and Occupants  | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |  |
| N2  | Activity Restrictions                                 | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |  |
| N3  | Common Area Landscape Management                      | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |  |
| N4  | BMP Maintenance                                       | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |  |
| N5  | Title 22 CCR Compliance (How development will comply) | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | No hazardous waste proposed onsite.          |
| N6  | Local Industrial Permit Compliance                    | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | Residential Development                      |
| N7  | Spill Contingency Plan                                | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | Residential Development                      |
| N8  | Underground Storage Tank Compliance                   | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | Residential Development                      |
| N9  | Hazardous Materials Disclosure Compliance             | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | No hazardous waste proposed onsite.          |
| N10                                       | Uniform Fire Code Implementation                      | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | No hazardous waste proposed onsite.          |
| N11                                       | Common Area Litter Control                            | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | Residential Development                      |
| N12                                       | Employee Training                                     | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | Residential Development                      |
| N13                                       | Housekeeping of Loading Docks                         | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | Residential Development                      |
| N14                                       | Common Area Catch Basin Inspection                    | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |  |
| N15                                       | Street Sweeping Private Streets and Parking Lots      | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |  |
| N16                                       | Retail Gasoline Outlets                               | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | Residential Development                      |

### IV.3.9 Structural Source Control BMPs

Fill out structural source control check box forms or provide a brief narrative explaining if structural source controls were not used.

| Structural Source Control BMPs |  |                                     |                                     |                                       |
|--------------------------------|--|-------------------------------------|-------------------------------------|---------------------------------------|
| Identifier                     | Name   | Check One                           |                                     | If not applicable, state brief reason |
|                                |  | Included                            | Not Applicable                      |                                       |
| S1                             | Provide storm drain system stenciling and signage  | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |                                       |
| S2                             | Design and construct outdoor material storage areas to reduce pollution introduction                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | Residential Development               |
| S3                             | Design and construct trash and waste storage areas to reduce pollution introduction                            | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | Residential Development               |
| S4                             | Use efficient irrigation systems & landscape design, water conservation, smart controllers, and source control | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |                                       |
| S5                             | Protect slopes and channels and provide energy dissipation   | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |                                       |
|                                | Incorporate requirements applicable to individual priority project categories (from SDRWQCB NPDES Permit)      | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | Residential Development               |
| S6                             | Dock areas   | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | Residential Development               |
| S7                             | Maintenance bays   | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | Residential Development               |

#### **IV.4 Alternative Compliance Plan (If Applicable)**

Describe an alternative compliance plan (if applicable). Include alternative compliance obligations (i.e., gallons, pounds) and describe proposed alternative compliance measures. *Refer to Section 7.II 3.0 in the WQMP.*

Not Applicable

#### **IV.4.1 Water Quality Credits**

Determine if water quality credits are applicable for the project. *Refer to Section 3.1 of the Model WQMP for description of credits and Appendix VI of the Technical Guidance Document (TGD) for calculation methods for applying water quality credits.*

| <b>Description of Proposed Project</b>   |   |   |  |
|--|---|---|--|
| <b>Project Types that Qualify for Water Quality Credits (Select all that apply):</b>   |   |   |  |
| <input type="checkbox"/> Redevelopment projects that reduce the overall impervious footprint of the project site.  | <input type="checkbox"/> Brownfield redevelopment, meaning redevelopment, expansion, or reuse of real property which may be complicated by the presence or potential presence of hazardous substances, pollutants or contaminants, and which have the potential to contribute to adverse ground or surface WQ if not redeveloped.   | <input type="checkbox"/> Higher density development projects which include two distinct categories (credits can only be taken for one category): those with more than seven units per acre of development (lower credit allowance); vertical density developments, for example, those with a Floor to Area Ratio (FAR) of 2 or those having more than 18 units per acre (greater credit allowance). |  |
| <input type="checkbox"/> Mixed use development, such as a combination of residential, commercial, industrial, office, institutional, or other land uses which incorporate design principles that can demonstrate environmental benefits that would not be realized through single use projects (e.g. reduced vehicle trip traffic with the potential to reduce sources of water or air pollution). | <input type="checkbox"/> Transit-oriented developments, such as a mixed use residential or commercial area designed to maximize access to public transportation; similar to above criterion, but where the development center is within one half mile of a mass transit center (e.g. bus, rail, light rail or commuter train station). Such projects would not be able to take credit for both categories, but may have greater credit assigned | <input type="checkbox"/> Redevelopment projects in an established historic district, historic preservation area, or similar significant city area including core City Center areas (to be defined through mapping).   |  |

**Priority Project Water Quality Management Plan (WQMP)**  
**Terraviva**

|   |  |   |  |   |
|---|--|---|--|---|
| <input type="checkbox"/> Developments with dedication of undeveloped portions to parks, preservation areas and other pervious uses. | <input type="checkbox"/> Developments in a city center area. | <input type="checkbox"/> Developments in historic districts or historic preservation areas. | <input type="checkbox"/> Live-work developments, a variety of developments designed to support residential and vocational needs together – similar to criteria to mixed use development; would not be able to take credit for both categories. | <input type="checkbox"/> In-fill projects, the conversion of empty lots and other underused spaces into more beneficially used spaces, such as residential or commercial areas. |
| Calculation of Water Quality Credits (if applicable)  | Not Applicable   |   |  |   |

**IV.4.2 Alternative Compliance Plan Information**

Describe an alternative compliance plan (if applicable). Include alternative compliance obligations (i.e., gallons, pounds) and describe proposed alternative compliance measures. *Refer to Section 7.II 3.0 in the Model WQMP.*

## Section V Inspection/Maintenance Responsibility for BMPs

Fill out information in table below. Prepare and attach an Operation and Maintenance Plan. Identify the funding mechanism through which BMPs will be maintained. Inspection and maintenance records must be kept for a minimum of five years for inspection by the regulatory agencies. *Refer to Section 7.II 4.0 in the Model WQMP.*

| BMP INSPECTION AND MAINTENANCE RESPONSIBILITY MATRIX   |                   |   |  |
|--|-------------------|---|--|
| Source Control BMP   | Responsible Party | Activity  | Frequency  |
| Dry Weather Flow Source Control<br><br><b>Note: this is a South Orange County High Priority Water Quality Condition for All Projects</b> | Owner             | Check for dry weather flows such as street washing, irrigation overspray, air conditioner condensate in areas of the project that do not drain to LID BMPs, the sanitary sewer, or landscaped pervious areas. Notify residents of any dry weather flows and follow up to correct. | Twice per year during dry season   |
|  |                   | Inspect project outfall or most-downstream project manhole for presence of dry weather flow. If present, conduct reconnaissance to determine source and implement actions to eliminate source.  | Twice per year during dry season   |
| N1. Education for Property Owner's Tenants and Occupants   | Owner             | Distribute appropriate materials to owners, tenants, and/or occupants via contract language, mailings, website, or meetings.  | Information provided to owners and tenants upon sale or lease. Reminders sent or posted as needed. |

| BMP INSPECTION AND MAINTENANCE RESPONSIBILITY MATRIX  |                   |  |  |
|---|-------------------|--|--|
| Source Control BMP  | Responsible Party | Activity   | Frequency  |
|   |                   | Check <a href="http://h2oc.org">h2oc.org</a> and/or City website for updated educational materials.  | Annually   |
| N2. Activity Restrictions   | Owner             | Within the CC&R's or lease agreement, restrict the following activities: <i>car washing outside of car wash areas.</i>   | Information provided to owners and tenants upon sale or lease. Reminders sent or posted as needed. |
| N3/S4. Common Area Landscape Management, Efficient Landscape Design, and Efficient Irrigation | Owner             | Check that fertilizer and pesticide usage is in accordance with the Integrated Pest Management Program. Adjust, if needed.   | Annually   |
|   |                   | Check the irrigation system water budget to ensure efficiency targets are being met and the system is in good condition. Adjust/repair irrigation system and controllers, if needed. | Annually prior to irrigation system activation   |
|   |                   | Check landscaping for presence of invasive species and remove, if needed.  | Annually   |

| <b>BMP INSPECTION AND MAINTENANCE RESPONSIBILITY MATRIX</b> |                          |  |  |
|---|--------------------------|--|--|
| <b>Source Control BMP</b>                                   | <b>Responsible Party</b> | <b>Activity</b>  | <b>Frequency</b>   |
| N14. Common Area Catch Basin Inspection                     | Owner                    | Remove trash and debris from catch basins and grates. Check for damage, clogging, and standing water. Repair or mitigate clogging/standing water, as needed.   | Four times per year during wet season, including inspection just before the wet season and within 24 hours after at least two storm events >0.5 inches |
| N15. Street Sweeping Private Streets and Parking Lots       | Owner                    | Sweep curb and gutter areas using a vacuum street sweeper. Report any significant or illicit debris in curb/gutter to HOA or responsible party, as needed.   | Weekly   |
| S1. Provide Storm Drain System Stenciling and Signage       | Owner                    | Check that all catch basins in paved areas marked or stenciled with "No dumping-Drains to Ocean; No Descargue Basura" language. Replace/repaint markings if faded, damaged, removed, or otherwise illegible. | Annually   |

| <b>BMP INSPECTION AND MAINTENANCE RESPONSIBILITY MATRIX</b> |                          |   |                  |
|---|--------------------------|---|------------------|
| <b>Source Control BMP</b>                                   | <b>Responsible Party</b> | <b>Activity</b>   | <b>Frequency</b> |
| S2. Design and Construct Outdoor Material Storage Areas     | Owner                    | Check outdoor material storage structure to ensure structural stability is sound and that no contact of the stored materials with rainfall or runoff is occurring. Check secondary containment for leaks. Repair leaks or damage, as needed and mitigate, if coming into contact with stormwater. | Twice per year   |
| S3. Design and Construct Trash and Waste Storage Areas      | Owner                    | Check that outdoor waste storage structure is consistently covered, that structural stability is sound, and that no run-on or contact of the trash with runoff is occurring. Repair leaks or damage and mitigate if trash coming into contact with stormwater, as needed.                         | Twice per year   |
|   |                          | Check that trash is removed by local waste management contractor on at least a weekly basis for proper disposal.  | Weekly           |

| <b>BMP INSPECTION AND MAINTENANCE RESPONSIBILITY MATRIX</b>    |                          |  |  |
|--|--------------------------|--|--|
| <b>Source Control BMP</b>                                      | <b>Responsible Party</b> | <b>Activity</b>  | <b>Frequency</b>   |
| S5. Protect Slopes and Channels and Provide Energy Dissipation | Owner                    | Check slopes, channels, riprap and other conveyance or energy dissipation areas for signs of erosion or scour. Replace material, repair channels, replant vegetation, and/or redesign, as needed for signs of erosion/scour.   | Four times per year during wet season, including inspection just before the wet season and within 24 hours after at least two storm events >0.5 inches |
| BIO-7 Proprietary Biotreatment                                 | Owner                    | Remove trash and debris. Identify excess erosion or scour, sediment accumulation that requires maintenance, any needed corrective maintenance that will require site-specific planning design. Inspect during storm event, when possible, to estimate treatment capacity and determine if premature bypass is occurring. Evaluate plant health and need for corrective action. | Four times per year during wet season, including inspection just before the wet season and within 24 hours after at least two storm events >0.5 inches |

| <b>BMP INSPECTION AND MAINTENANCE RESPONSIBILITY MATRIX</b>                     |                          |  |                  |
|---|--------------------------|--|------------------|
| <b>Source Control BMP</b>   | <b>Responsible Party</b> | <b>Activity</b>  | <b>Frequency</b> |
| HSC- 2 Impervious Area Dispersion (Downspout Disconnect, Sheet Flow Dispersion) | Owner                    | Confirm presence of HSC. Remove trash. Check facility for excessive sediment accumulation (>~ 1 inch), major erosion, damage, channelization, loss of vegetation, and standing water. Check downspout and flow spreader for damage or clogging. Remove sediment, restore vegetation, scarify soil, and/or otherwise mitigate, as needed, to restore functionality. | Annually         |

## **Section VI BMP Exhibit (Site Plan)**

### **VI.1 BMP Exhibit (Site Plan)**

Include a BMP Exhibit (Site Plan), at a size no less than 24" by 36," which includes the following minimum information:

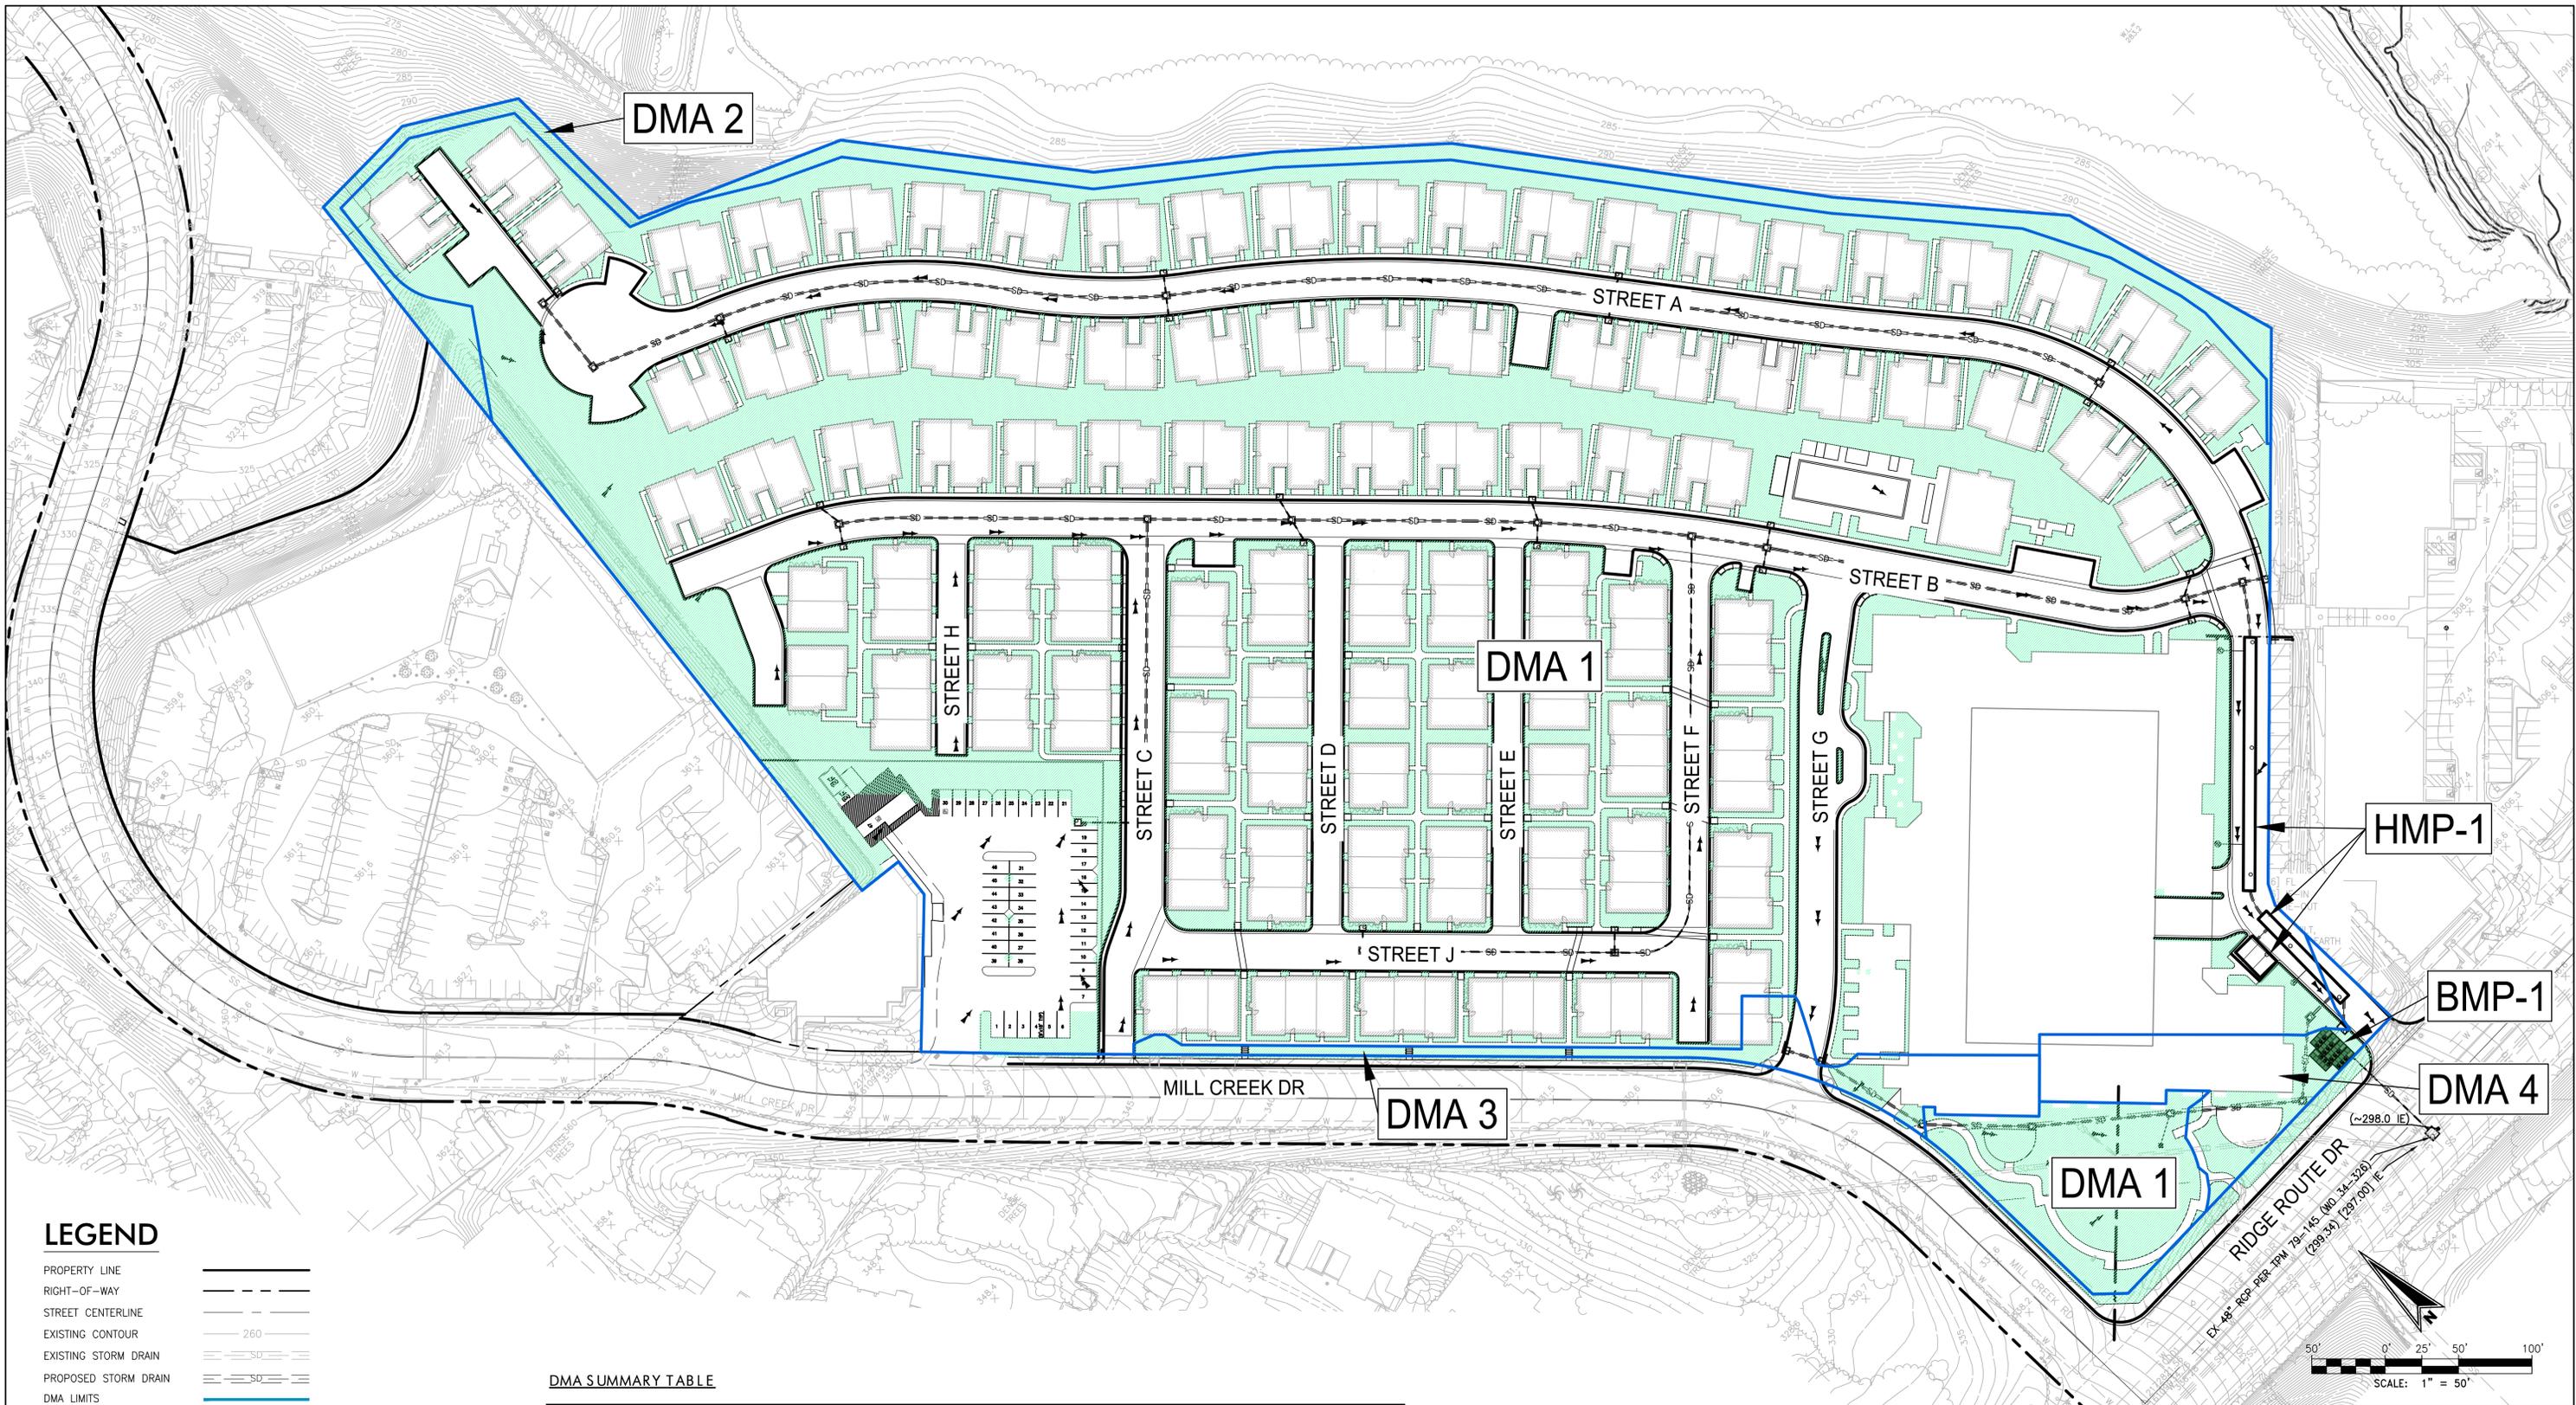

- Insert in the title block (lower right hand corner) of BMP Exhibit: the WQMP Number (assigned by staff) and the grading/building or Planning Application permit numbers
- Project location (address, tract/lot number(s), etc.)
- Site boundary
- Land uses and land covers, as applicable
- Suitability/feasibility constraints
- Structural BMP locations
- Drainage delineations and flow information
- Delineate the area being treated by each structural BMP
- GIS coordinates for LID and Treatment Control BMPs
- Drainage connections
- BMP details
- Preparer name and stamp

Please do not include any areas outside of the project area or any information not related to drainage or water quality. The approved BMP Exhibit (Site Plan) shall be submitted as a plan sheet on all grading and building plan sets submitted for plan check review and approval. The BMP Exhibit shall be at the same size as the rest of the plan sheets in the submittal and shall have an approval stamp and signature prior to plan check submittal.

### **VI.2 Submittal and Recordation of Water Quality Management Plan**

Following approval of the Final Project-Specific WQMP, three copies of the approved WQMP (including BMP Exhibit, Operations and Maintenance (O&M) Plan, and Appendices) shall be submitted. In addition, these documents shall be submitted in a PDF format.

Each approved WQMP (including BMP Exhibit, Operations and Maintenance (O&M) Plan, and Appendices) shall be recorded in the Orange County Clerk-Recorder's Office, prior to close-out of grading and/or building permit. Educational Materials are not required to be included.

## Worksheet J: Summary of Harvested Water Demand and Feasibility

|  |  |          |             |
|--|--|----------|-------------|
| 1  | What demands for harvested water exist in the tributary area (check all that apply):                             |          |             |
| 2  | Toilet and urinal flushing   |          |             |
| 3  | Landscape irrigation   | <b>X</b> |             |
| 4  | Other: _____   |          |             |
| 5  | What is the design capture storm depth? (Figure III.1)   | d        | 0.80 inches |
| 6  | What is the project size?  | A        | 15.97 ac    |
| 7  | What is the acreage of impervious area?  | IA       | 4.31 ac     |
| <b>For projects with multiple types of demand (toilet flushing, irrigation demand, and/or other)</b>   |  |          |             |
| 8  | What is the minimum use required for partial capture? (Table X.6)  | N/A      | gpd         |
| 9  | What is the project estimated wet season total daily use (Section X.2)?  | N/A      | gpd         |
| 10   | Is partial capture potentially feasible? (Line 9 > Line 8?)  | N/A      |             |
| <b>For projects with only toilet flushing demand</b>   |  |          |             |
| 11   | What is the minimum TUTIA for partial capture? (Table X.7)   | N/A      |             |
| 12   | What is the project estimated TUTIA?   | N/A      |             |
| 13   | Is partial capture potentially feasible? (Line 12 > Line 11?)  | N/A      |             |
| <b>For projects with only irrigation demand</b>  |  |          |             |
| 14   | What is the minimum irrigation area required based on conservation landscape design? (Table X.8)                 | 11.19    | ac          |
| 15   | What is the proposed project irrigated area? (multiply conservation landscaping by 1; multiply active turf by 2) | 4.31     | ac          |
| 16   | Is partial capture potentially feasible? (Line 15 > Line 14?)  | No       |             |
| Provide supporting assumptions and citations for controlling demand calculation:   |  |          |             |
| <i>Minimum EIATA for Conservation-Type Landscaping per Table X.8 = 0.96 ac/ac</i><br><i>Project Impervious Area = 11.66 ac</i><br><i>Minimum Irrigated Area = Project Impervious Area x EIATA 11.19 ac</i> |  |          |             |

**TABLE X.8: MINIMUM IRRIGATED AREA FOR POTENTIAL PARTIAL CAPTURE FEASIBILITY**

| General Landscape Type             | Conservation Design: KL = 0.35  |        |           | Active Turf Areas: KL = 0.7 |        |           |

## Section 1 Project Description and BMP Overview

| <b>General Project Attributes and Stormwater Control Measures</b> |   |               |
|---|---|---------------|
| Site Location   | 23282 Mill Creek Dr, Laguna Hills, CA 92653   |               |
| Project Area (ft <sup>2</sup> ): 695,725                          | Number of Dwelling Units: 480   | SIC Code: N/A |
| Narrative Project Description:                                    | <p><i>The proposed residential development will consist of 480 dwelling units, approximately 700,000 SF of a combination of a multifamily residential building, multiple duplexes and triplexes, and associated amenity spaces such as parks and lounges. Some existing driveways will be removed, and new asphalt driveways will be added to existing access roads on Mill Creek Drive and Ridge Route Drive. New improvements in the area and its frontage include the addition of public storm drain, water, &amp; sewer utilities. No off-site drainage is anticipated.</i></p>                                 |               |
| Project-specific Source Control BMPs                              | <p><i>N1: Education for Property Owners, Tenants and Occupants</i></p> <p><i>N2: Activity Restrictions</i></p> <p><i>N3: Common Area Landscape Management</i></p> <p><i>N4: BMP Maintenance</i></p> <p><i>N14: Common Area Catch Basin Inspection</i></p> <p><i>N15: Street Sweeping Private Streets and Parking Lots</i></p> <p><i>S1: Provide storm drain system stenciling and signage</i></p> <p><i>S4: Use efficient irrigation systems &amp; landscape design, water conservation, smart controllers, and source control</i></p> <p><i>S5: Protect slopes and channels and provide energy dissipation</i></p> |               |

## General Project Attributes and Stormwater Control Measures

|  |   |
|--|---|
| <p>Summary of Drainage Patterns</p>                    | <p><i>The project will maintain existing drainage patterns to the maximum extent practical. The onsite drainage is divided into flow originating from the multistory area and flow originating around the single-family residential area. It is composed of concentrated flow moving towards the south through the proposed storm drain pipeline system. Onsite storm water runoff from both areas is detained in a proprietary underground storage system with the purpose of reaching 100-year peak flow attenuation. This runoff is then conveyed to a proprietary treatment control BMP system that leads to a proposed 24-inch storm drain main joined to an existing 48-inch RCP storm drain main in Ridge Route Dr.</i></p> <p><i>Offsite drainage on Mill Creek Drive will continue to convey into the storm drain inlet. Offset drainage on Ridge Route Drive will continue to move along the northern side of the street into the type II storm drain catch basin. This flow will advance north via the existing 48-inch RCP storm drain main. The runoff at the asphalt parking lot on the western section and the residential's gate entrance area will be carried across the northeastern curb and gutter of Mill Creek Dr into the existing storm drain inlet. The existing slope along the northern property boundary is reduced compared to existing conditions due to the construction of duplexes on the northeastern side and is comprised of sheet flow.</i></p> <p><i>All flows ultimately draining north into the Veeh Reservoir.</i></p> |
| <p>Summary of Hydrologic Source Controls</p>           | <p>N/A</p>  |
| <p>Structural Treatment and Hydromodification BMPs</p> | <p><i>A proprietary biotreatment BMP (Filtterra) is proposed.</i></p>   |

| BMP ID | BMP Type                                | Narrative Description  | Location   | Other Considerations |
|--------|---|--|--|----------------------|
| BMP 1  | <i>Proprietary Biotreatment (BIO-7)</i> | <i>A proprietary BMP biotreatment (Filtterra) planter box is proposed. Receives flow from DMA 1.</i> | <i>North of Ridge Route Dr near southeastern project border.</i> | N/A                  |

## Section 2 Personnel, Documentation, and Reporting

### 2.1 Maintenance Roles and Responsibilities

The roles related to O&M of the BMPs are defined as follows:

- **Facility Owner** – *The Facility Owner is the party who is ultimately responsible for the functionality of all BMPs. The maintenance agreement (Attachment 2) identifies the facility owner for each BMP, including the timing of any ownership transitions.*
- **Responsible Party** – *The Responsible Party is the party that shall have direct responsibility for the O&M of the BMPs. This party shall be the designated contact with inspectors and lead maintenance personnel. The Responsible Party shall sign self-inspection reports and any correspondence regarding the verification of inspections and required maintenance. The Responsible Party will establish a system to delegate general inquiries to the appropriate maintenance personnel concerning the operation and maintenance of the BMPs. The Responsible Party reports directly to the Facility Owner and operates and manages the BMPs on the Facility Owner’s behalf.*
- **Designated Emergency Respondent** – *The Designated Emergency Respondent is the party responsible for directing activities and communications during emergencies such as broken irrigation pipes, landslides, hazardous spill responses etc., that would require immediate response should they occur during off-hours. It is the responsibility of the Designated Emergency Respondent to communicate the emergent situation with the Responsible Party as soon as possible.*
- **Key Maintenance Personnel** – *Key Maintenance Personnel are the designated lead field manager(s) or supervisor(s) who directly oversee and delegate the maintenance activities, maintain the scheduling, and coordinate activities between all personnel. These tend to change more often than other personnel over time, so their names do not necessarily need to be included in the O&M Plan. However, they must be properly trained as recorded in the training logs (Section 2.2).*

The table below lists the roles for this project. This table must be updated whenever changes occur.

| Role              | Name (Title and Affiliation)                        | Phone Number   | Address   | Email Address        |
|-------------------|---|----------------|---|----------------------|
| Facility Owner    | <i>John Stack,<br/>Kingsbarn<br/>Realty Capital</i> | (650) 782-3300 | 2500 Sand Hill<br>Road, Suite 320,<br>Menlo Park, CA<br>94025 | jstack@kingsbarn.com |
| Responsible Party | <i>John Stack,<br/>Kingsbarn<br/>Realty Capital</i> | (650) 782-3300 | 2500 Sand Hill<br>Road, Suite 320,                            | jstack@kingsbarn.com |

|                                       |   |                |   |                      |
|---------------------------------------|---|----------------|---|----------------------|
|                                       |   |                | Menlo Park, CA<br>94025                                       |                      |
| Designated<br>Emergency<br>Respondent | <i>John Stack,<br/>Kingsbarn<br/>Realty Capital</i> | (650) 782-3300 | 2500 Sand Hill<br>Road, Suite 320,<br>Menlo Park, CA<br>94025 | jstack@kingsbarn.com |

## **2.2 Qualification and Training Requirements for Personnel**

Many of the activities presented in this O&M plan can be completed by personnel with basic landscaping and yard maintenance skills and project-specific orientation. However, there are activities that require a more experienced skillset to identify and remediate potential issues that could compromise the functionality of each BMP. The Responsible Party shall exercise discretion in determining the skillset required to complete each task.

Activities that can typically be completed by maintenance personnel with basic training and/or qualifications include:

- General landscaping activities (pruning, weeding, and raking)
- Routine sediment, trash and debris removal;
- Filling in minor scour or erosion areas, or replacing rip rap that has become displaced; and
- Watering or irrigation, as necessary.

Activities that typically require maintenance personnel with specialized qualifications, training, and/or engineering oversight include:

- Inspection and/or repair of inflow and outflow structures;
- Inspection and/or repair of underground elements;
- Large-volume sediment or media removal requiring specialized equipment;
- Inspection, diagnosis, and remediation of significant erosion issues potentially compromising function and/or structural stability; and
- Spill response and remediation.

Maintenance personnel who have identified a potential major issue with any facility should contact the designated key maintenance personnel for the facility immediately.

Training must be provided for all personnel performing maintenance tasks on or providing maintenance oversight of structural BMPs. The table below provides the personnel and relevant training topics.

Training Logs contained in Attachment 3 should be used to document training of maintenance personnel.

| Training Topic  | Responsible Party | Designated<br>Emergency<br>Respondent | Key<br>Maintenance<br>Personnel |
|---|-------------------|---------------------------------------|---------------------------------|
| Proper Maintenance of all BMP components  | <b>X</b>          |                                       | <b>X</b>                        |
| Identification and clean-up procedures for spills and overflows                 | <b>X</b>          | <b>X</b>                              | <b>X</b>                        |
| Safety concerns when maintaining devices and responding to emergency situations | <b>X</b>          | <b>X</b>                              | <b>X</b>                        |

### **2.3 Maintenance Agreements and Funding Mechanisms**

*Kingsbarn Realty Capital will operate the BMPs and provide funding for maintenance.*

### **2.4 Record Keeping Requirements**

Documentation of site conditions, maintenance activities performed, and any other remaining maintenance required is necessary during each inspection/ maintenance visit. Inspection and maintenance records shall be retained in an accessible, secure location for the life of the facility, and not less than 10 years.

The following documentation mechanisms and procedures have been established for this O&M Plan:

- **Training Logs:** Personnel must document training activities as part of implementing this O&M Plan. Attachment 3 contains a sample training log.
- **Inspection and Routine Maintenance Logs:** Maintenance personnel are required to maintain logs of inspection and maintenance activities. Attachment 4 contain inspection and maintenance logs.
- **Rehabilitative and Corrective Maintenance Log and Reporting:** Rehabilitation and corrective maintenance activities should be documented at a degree of detail that is commensurate to the complexity/significance of the activity. Any significant changes to the BMP designs that arise from rehabilitation/corrective maintenance will be documented via an update to the Project WQMP and as-built drawings. Corrective maintenance that does

not result in design changes will be documented as a special entry in the maintenance logs to provide pertinent details of that rehabilitative or corrective maintenance activity.

*No monitoring is required.*

## **2.5 Required Permits Associated with Maintenance Activities**

*No permits are required.*

## **2.6 Self-Reporting Requirements**

*No self-reporting is required.*

## **2.7 City Inspections**

The *City of Laguna Hills* may conduct a site inspection to evaluate compliance with the Project WQMP, at any time.

## **2.8 Electronic Data Submittal**

This document, along with the attachments, shall be provided to the City or County in PDF format. AutoCAD files and/or GIS coordinates of BMPs shall also be submitted to the City/County.

## Section 3 Inspection and Maintenance Activities

This section identifies the inspection and O&M activities for each BMP incorporated into the project. Section 3.1 and 3.2 contain common maintenance activities and frequencies associated with Source Control BMPs and HSCs, respectively. Section 3.3 contains individual tables for each structural LID or hydromodification BMP with an explanation of the various types of maintenance activities associated with these BMPs.

### 3.1 Inspection and Maintenance of Source Control BMPs

| Source Control BMP   | Activity  | Frequency  |
|--|---|--|
| Dry Weather Flow Source Control<br><br><b>Note: this is a South Orange County High Priority Water Quality Condition for All Projects</b> | Check for dry weather flows such as street washing, irrigation overspray, air conditioner condensate in areas of the project that do not drain to LID BMPs, the sanitary sewer, or landscaped pervious areas. Notify residents of any dry weather flows and follow up to correct. | Twice per year during dry season   |
|  | Inspect project outfall or most-downstream project manhole for presence of dry weather flow. If present, conduct reconnaissance to determine source and implement actions to eliminate source.  | Twice per year during dry season   |
| N1. Education for Property Owner's Tenants and Occupants   | Distribute appropriate materials to owners, tenants, and/or occupants via contract language, mailings, website, or meetings.  | Information provided to owners and tenants upon sale or lease. Reminders sent or posted as needed. |
|  | Check <a href="http://www.ocwatersheds.com">www.ocwatersheds.com</a> and/or City website for updated educational materials.   | Annually   |
| N2. Activity Restrictions  | Within the CC&R's or lease agreement, restrict the following activities: <i>car washing outside of car wash areas.</i>  | Information provided to owners and tenants upon sale or lease. Reminders sent or posted as needed. |

| Source Control BMP  | Activity  | Frequency  |
|---|---|--|
| N3/S4. Common Area Landscape Management, Efficient Landscape Design, and Efficient Irrigation | Check that fertilizer and pesticide usage is in accordance with the Integrated Pest Management Program. Adjust, if needed.  | Annually   |
|   | Check the irrigation system water budget to ensure efficiency targets are being met and the system is in good condition. Adjust/repair irrigation system and controllers, if needed.  | Annually prior to irrigation system activation   |
|   | Check landscaping for presence of invasive species and remove, if needed.   | Annually   |
| N14. Common Area Catch Basin Inspection   | Remove trash and debris from catch basins and grates. Check for damage, clogging, and standing water. Repair or mitigate clogging/standing water, as needed.  | Four times per year during wet season, including inspection just before the wet season and within 24 hours after at least two storm events >0.5 inches |
| N15. Street Sweeping Private Streets and Parking Lots   | Sweep curb and gutter areas using a vacuum street sweeper. Report any significant or illicit debris in curb/gutter to HOA or responsible party, as needed.  | Weekly   |
| S1. Provide Storm Drain System Stenciling and Signage   | Check that all catch basins in paved areas marked or stenciled with “No dumping-Drains to Ocean; No Descargue Basura” language. Replace/repaint markings if faded, damaged, removed, or otherwise illegible.  | Annually   |
| S2. Design and Construct Outdoor Material Storage Areas                                       | Check outdoor material storage structure to ensure structural stability is sound and that no contact of the stored materials with rainfall or runoff is occurring. Check secondary containment for leaks. Repair leaks or damage, as needed and mitigate, if coming into contact with stormwater. | Twice per year   |

| Source Control BMP   | Activity  | Frequency  |
|--|---|--|
| S3. Design and Construct Trash and Waste Storage Areas         | Check that outdoor waste storage structure is consistently covered, that structural stability is sound, and that no run-on or contact of the trash with runoff is occurring. Repair leaks or damage and mitigate if trash coming into contact with stormwater, as needed. | Twice per year   |
|  | Check that trash is removed by local waste management contractor on at least a weekly basis for proper disposal.  | Weekly   |
| S5. Protect Slopes and Channels and Provide Energy Dissipation | Check slopes, channels, riprap and other conveyance or energy dissipation areas for signs of erosion or scour. Replace material, repair channels, replant vegetation, and/or redesign, as needed for signs of erosion/scour.  | Four times per year during wet season, including inspection just before the wet season and within 24 hours after at least two storm events >0.5 inches |

### **3.2 Inspection and Maintenance of Hydrologic Source Controls**

*No HSCs are proposed.*

### **3.3 Inspection and Maintenance of Structural LID and Hydromodification BMPs**

The section is organized by type of structural LID or hydromodification BMP with separate tables for each BMP type included in the project. The section identifies four categories of activities related to O&M of the BMPs:

**General Inspections** - Evaluations conducted at regularly scheduled intervals to indicate the need for maintenance of structural BMPs.

**Routine Maintenance Activities** - Activities conducted at regularly scheduled intervals to sustain long-term performance of each BMP, including inspections and normal upkeep.

**Corrective (Major) Maintenance Activities** - Includes activities conducted to replace or rehabilitate system components at the end of their usable life as well as activities conducted to resolve major issues that are not anticipated.

**Emergency Response Activities** – Activities related to emergencies, primarily concerning spills, which may require immediate action and notifications (Section 3.4).

| BMP ID       | BMP Type                 | Reference Maintenance Table |
|--------------|--------------------------|-----------------------------|
| <i>BMP 1</i> | Proprietary Biotreatment | <i>BIO-7 (Page 8)</i>       |

| <b>BIO-5/7 Proprietary Biotreatment</b>   |   |
|---|---|
| Activity  | Frequency   |
| GENERAL INSPECTIONS   |   |
| Remove trash and debris   | Four times per year during wet season, including inspection just before the wet season and within 24 hours after at least two storm events $\geq 0.5$ inches. |
| Identify excess erosion or scour  |   |
| Identify sediment accumulation that requires maintenance  |   |
| Inspect during storm event, when possible, to estimate treatment capacity and determine if premature bypass is occurring  |   |
| Evaluate plant health and need for corrective action  |   |
| Identify any needed corrective maintenance that will require site-specific planning or design   |   |
| OPERATION AND MAINTENANCE   |   |
| <ul style="list-style-type: none"> <li>• O&amp;M of proprietary BMPs must follow established manufacturer guidelines</li> <li>• O&amp;M of accompanying retention BMPs should follow the guidelines established in the associated fact sheet for that BMP.</li> </ul> |   |

### **3.4 Emergency Response Plan**

In some cases, adverse conditions may occur which could be an imminent threat to human or environmental health or severe damage to infrastructure or property. For example, a spill of hazardous substances in the contributing area to a BMP could cause harmful substances to enter the BMP and be released downstream, affecting environmental and public health. Other emergencies could arise related to the stormwater features or water quality protection, such as landsliding, major erosion, or burst pipes in the tributary area.

In the event of an actual or suspected hazardous material release, the following plan shall take effect.

The primary importance of initial response to an actual or suspected spill will be public safety, control of the source of pollution, and containment of spills that have occurred, as applicable. The table below provides the emergency contact information for hazardous materials spills affecting BMPs.

| Name  | Phone          | When to Report |
|---|----------------|----------------|
| Local Emergency Response (Fire Department)                      | 911            | Immediately    |
| Orange County 24-Hour Water Pollution Problem Reporting Hotline | 1-877-897-7455 | Immediately    |
| CalOES State Warning Center                                     | 1-800-852-7550 | Immediately    |

The first number to call is emergency response (9-1-1), followed by the California Governor's Office of Emergency Services (CalOES), formerly the California Emergency Management Agency (CalEMA). (CalOES) maintains guidance and instructions of what to do in the event of a spill of hazardous substances (<http://www.caloes.ca.gov/cal-oes-divisions/fire-rescue/hazardous-materials/spill-release-reporting>). This plan is based on the guidance provided by CalOES (CalOES, 2014).

1. If an actual or suspected hazardous material incident exists, maintenance personnel will immediately call 911 and the CalOES State Warning Center (**Error! Reference source not found.**).
2. The Designated Emergency Respondent and Responsible Party assigned to the facility (from Section 2.1) must also be notified of any actual or potential spill.
3. Remediation of contamination in the water quality facility should be handled as a corrective maintenance issue per Section 3.2 of this O&M plan.

In the event that a potential spill is identified prior to it reaching the BMPs, the Designated Emergency Respondent will implement an isolation protocol to prevent the spill from entering the BMP. An inflatable plug, Hazmat Plug, or equivalent device as approved by the Designated Emergency Respondent will be installed within the storm drains or catch basins to block upstream flow from reaching and contaminating the BMP. The temporary plug will be an interim measure until the spill is properly maintained and remediated and the Designated Emergency Respondent has determined the risk to the BMP of contamination no longer exists.

Similar measures should be taken in the event of a landslide, mudslide, or major erosion within the tributary area of the BMP to prevent sediment from damaging the BMP to the extent possible.

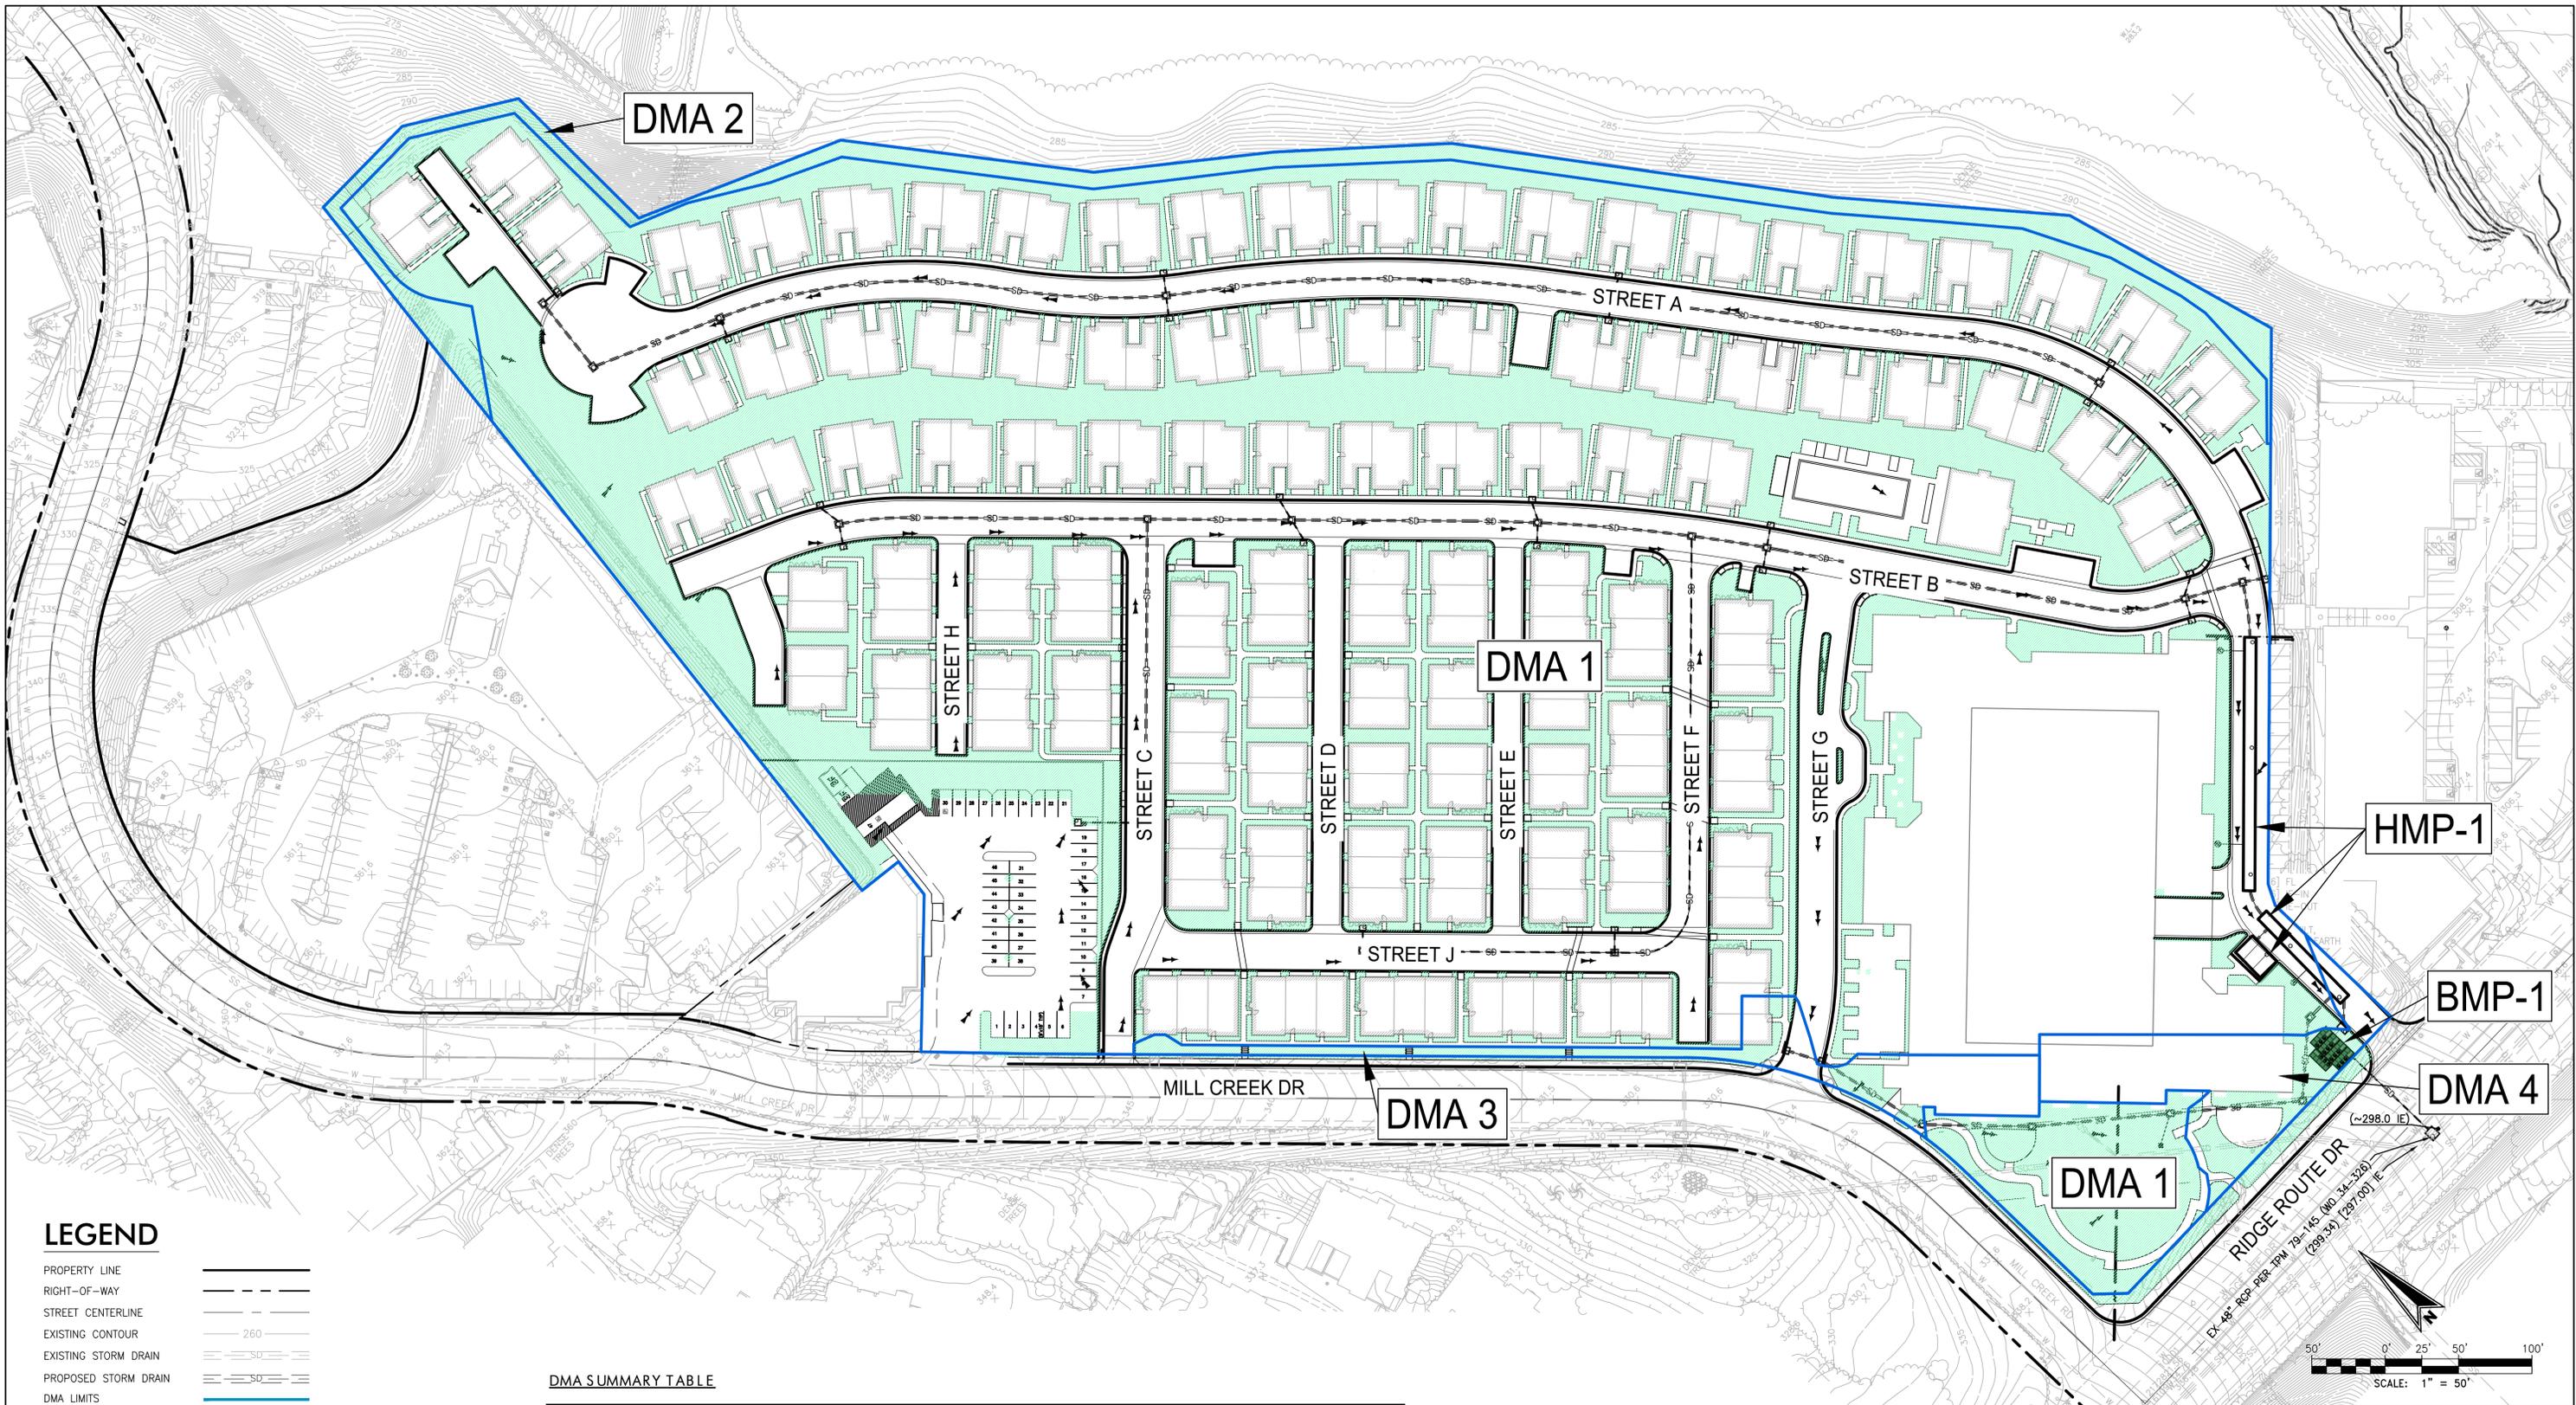

### **3.5 Vector Control**

In addition to the inspection and maintenance activities listed in Section 3, all BMPs shall be inspected for standing water on a regular basis. Standing water which exists for longer than 72 hours may contribute to mosquito breeding areas. Standing water may indicate that the BMP is not functioning properly and proper action to remedy the situation shall be taken in a timely manner.

Elimination of standing water and managing garbage, lawn clippings, and pet droppings can help decrease the present of mosquitoes and flies in the area.

The Orange County Vector Control District may be contacted for more information and support at 714-971-2421 or 949-654-2421 or [www.ocvcd.org](http://www.ocvcd.org).

## OVERVIEW

This operation and maintenance (O&M) manual is for the Modular Wetlands Linear Biofilter (MWL). Please read the instructions and equipment lists closely prior to starting. It is important to follow all necessary safety procedures associated with state and local regulations. Please contact Contech for more information on pre-authorized third-party service providers who can provide inspection and maintenance services in your area. For a list of service providers in your area, please visit [www.conteches.com/maintenance](http://www.conteches.com/maintenance).

### WARNING

Confined space entry may be required. Contractor to obtain all equipment and training to meet applicable local and OSHA regulations regarding confined space entry. It is the Contractor's or entry personnel's responsibility to always proceed safely.

## SAFETY NOTICE & PERSONAL SAFETY EQUIPMENT

Job site safety is a topic and a practice addressed comprehensively by others. The inclusions here are merely reminders to whole areas of Safety Practice that are the responsibility of the Owner(s), Manager(s), and Service Provider(s). OSHA and Canadian OSH, Federal, State/Provincial, and Local Jurisdiction Safety Standards apply on any given site or project. The knowledge and applicability of those responsibilities is the Service Provider's responsibility and outside the scope of Contech Engineered Solutions.

Safety Boots

Gloves

Hard Hat

Eye Protection

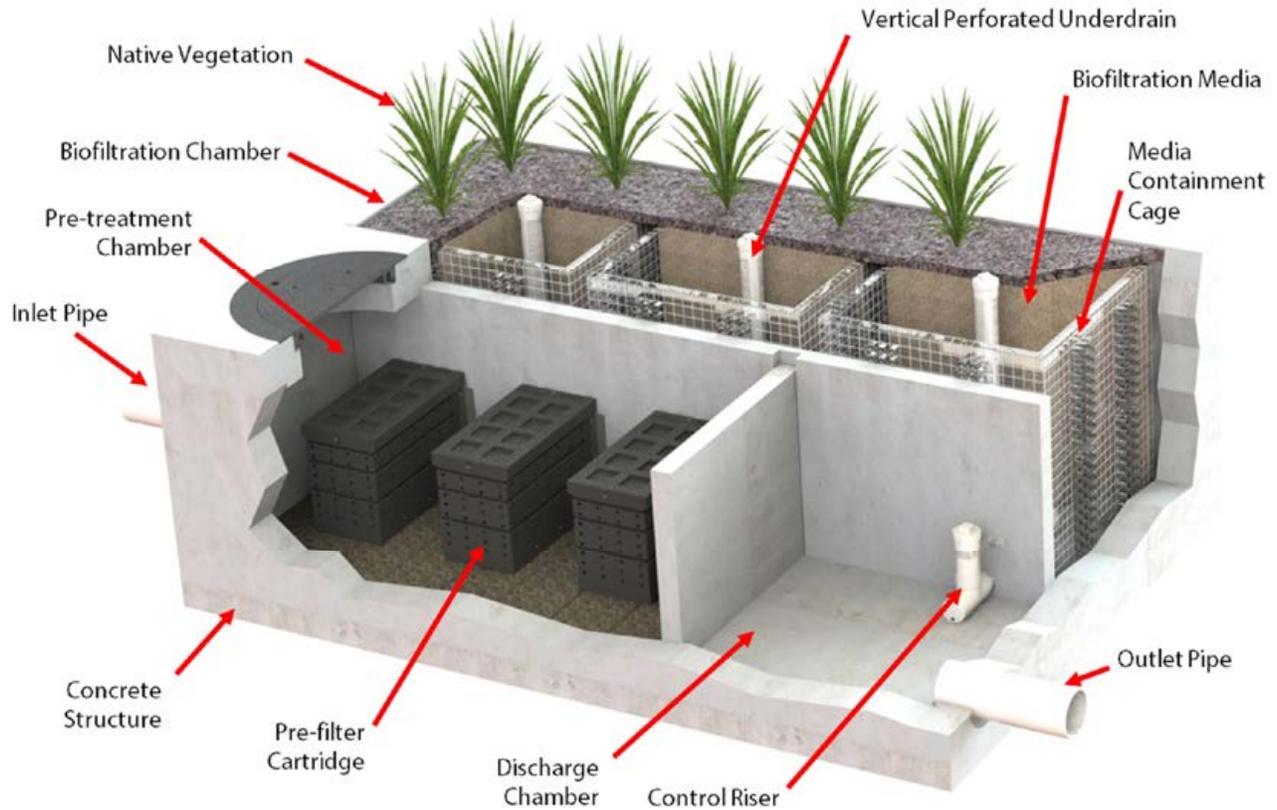

Maintenance and Protection  
of Traffic Plan

## MODULAR WETLANDS LINEAR COMPONENTS LIST

The MWL system comes in multiple sizes and configurations, including side by side or end to end layouts, both as open planters or underground systems. See shop drawings (plans) for project specific details.

The standard MWL system is comprised of the following components:

## INSPECTION SUMMARY & EQUIPMENT LIST

Stormwater regulations require BMPs be inspected and maintained to ensure they are operating as designed to allow for effective pollutant removal and provide protection to receiving water bodies. It is recommended that inspections be performed multiple times during the first year to assess the site-specific loading conditions. The first year of inspections can be used to set inspection and maintenance intervals for subsequent years to ensure appropriate maintenance is provided.

- Inspect pre-treatment, biofiltration, and discharge chambers an average of once every six to twelve months. Varies based on site specific and local conditions.
- Average inspection time is approximately 15 minutes. Always ensure appropriate safety protocol and procedures are followed.

The following is a list of equipment required to allow for simple and effective inspection of the MWL:

Modular Wetlands Linear  
Inspection Form

Flashlight

Tape Measure

Access Cover Hook

Ratchet  
& 7/16" Socket  
(if required for older pre-filter  
cartridges that have two  
bolts holding the lids on)

## INSPECTION & MAINTENANCE NOTES

1. Following maintenance and/or inspection, it is recommended that the maintenance operator prepare a maintenance/inspection record. The record should include any maintenance activities performed, amount and description of debris collected, and condition of the system and its various filter mechanisms.
2. The owner should keep maintenance/inspection record(s) for a minimum of five years from the date of maintenance. These records should be made available to the governing municipality for inspection upon request at any time.
3. Transport all debris, trash, organics, and sediments to approved facility for disposal in accordance with local and state requirements.
4. Entry into chambers may require confined space training based on state and local regulations.
5. No fertilizer shall be used in the biofiltration chamber.
6. Irrigation should be provided as recommended by manufacturer and/or landscape architect. Amount of irrigation required is dependent on plant species. Some plants may not require irrigation after initial establishment.

## INSPECTION PROCESS

1. Prepare the inspection form by writing in the necessary information including project name, location, date & time, unit number and other information (see inspection form).
2. Observe the inside of the system through the access covers. If minimal light is available and vision into the unit is impaired, utilize a flashlight to see inside the system and all chambers.
3. Look for any out of the ordinary obstructions in the inflow pipe, pre-treatment chamber, biofiltration chamber, discharge chamber or outflow pipe. Write down any observations on the inspection form.
4. Through observation and/or digital photographs, estimate the amount of trash, debris accumulated in the pre-treatment chamber. Utilizing a tape measure or measuring stick, estimate the amount of sediment in this chamber. Record this depth on the inspection form.
5. Through visual observation, inspect the condition of the pre-filter cartridges. Look for excessive build-up of sediment on the cartridges, any build-up on the tops of the cartridges, or clogging of the holes. Record this information on the inspection form. The pre-filter cartridges can be further inspected by removing the cartridge tops and assessing the color of the BioMediaGREEN filter cubes (requires entry into pre-treatment chamber - see notes previous notes regarding confined space entry). Record the color of the material. New material is a light green color. As the media becomes clogged, it will turn darker in color, eventually becoming dark brown or black. The closer to black the media is the higher percentage that the media is exhausted and in need of replacement.

New  
BioMediaGREEN  
0%

Exhausted  
BioMediaGREEN  
100%

85%

6. The biofiltration chamber is generally maintenance-free due to the system's advanced pre-treatment chamber. For units which have open planters with vegetation, it is recommended that the vegetation be inspected. Look for any plants that are dead or showing signs of disease or other negative stressors. Record the general health of the plants on the inspection form and indicate through visual observation or digital photographs if trimming of the vegetation is required.
7. The discharge chamber houses the control riser (if applicable), drain down filter (only in California - older models), and is connected to the outflow pipe. It is important to check to ensure the orifice is in proper operating condition and free of any obstructions. It is also important to assess the condition of the drain down filter media which utilizes a block form of the BioMediaGREEN. Assess in the same manner as the cubes in the pre-filter cartridge as mentioned above.
8. Finalize the inspection report for analysis by the maintenance manager to determine if maintenance is required.

## MAINTENANCE INDICATORS

Based upon the observations made during inspection, maintenance of the system may be required based on the following indicators:

- Missing or damaged internal components or cartridges.
- Obstructions in the system or its inlet and/or outlet pipes.
- Excessive accumulation of floatables in the pre-treatment chamber in which the length and width of the chamber is fully impacted more than 18".
- Excessive accumulation of sediment in the pre-treatment chamber of more than 6" in depth.
- Excessive accumulation of sediment on the BioMediaGREEN media housed within the pretreatment cartridges. When media is more than 85% clogged, replacement is required. The darker the BioMediaGREEN, the more clogged it is and in need of replacement.
- Excessive accumulation of sediment on the BioMediaGREEN media housed within the drain down filter (California only - older models).
- Overgrown vegetation.

## MAINTENANCE SUMMARY & EQUIPMENT LIST

The time has come to maintain your MWL. All necessary pre-maintenance steps must be carried out before maintenance occurs. Once traffic control has been set up per local and state regulations and access covers have been safely opened, the maintenance process can begin. It should be noted that some maintenance activities require confined space entry. All confined space requirements must be strictly followed before entry into the system. In addition, the following is recommended:

- Prepare the maintenance form by writing in the necessary information including project name, location, date & time, unit number and other info (see maintenance form).
- Set up all appropriate safety and maintenance equipment.
- Ensure traffic control is set up and properly positioned.
- Prepared pre-checks (OSHA, safety, confined space entry) are performed.
  - A gas meter should be used to detect the presence of any hazardous gases prior to entering the system. If hazardous gases are present, do not enter the vault. Following appropriate confined space procedures, take steps such as utilizing a venting system to address the hazard. Once it is determined to be safe, enter the system utilizing appropriate entry equipment such as a ladder and tripod with harness.

The following is a list of equipment required for maintenance of the MWL:

Modular Wetlands Linear  
Maintenance Form

Flashlight

Access Cover Hook

Ratchet  
& 7/16" Socket  
(if required for older pre-filter  
cartridges that have two  
bolts holding the lids on)

Vacuum Assisted Truck with  
Pressure Washer

Replacement  
BioMediaGREEN  
(If Required)

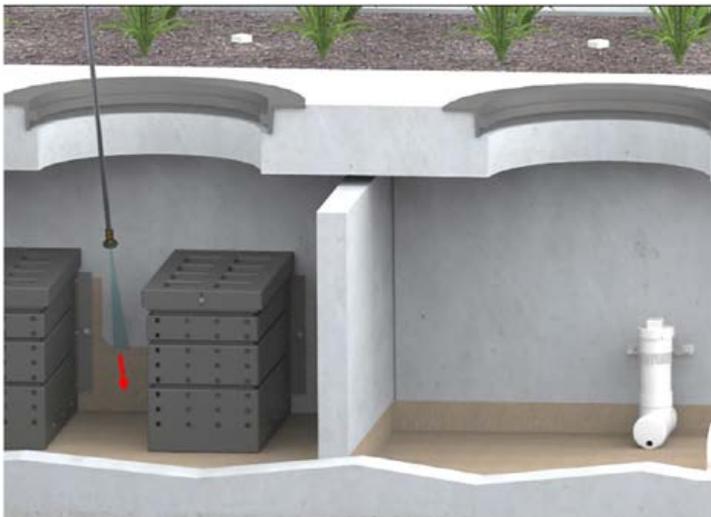

(order BioMediaGREEN from Contech's Maintenance Team members at <https://www.conteches.com/maintenance>)

## MAINTENANCE INSTRUCTIONS

### 1. ACCESS COVER REMOVAL

Upon determining that the vault is safe for entry, remove all access cover(s) and position the vacuum truck accordingly.

### 2. PRESSURE WASH SYSTEM CHAMBERS

With the pressure washer, spray down pollutants accumulated on the walls and floors of the pre-treatment and discharge chambers. Then wash any accumulated sediment from the pre-filter cartridge(s).

### 3. VACUUM SYSTEM CHAMBERS

Vacuum out pre-treatment and discharge chambers and remove all accumulated pollutants including trash, debris, and sediments. Be sure to vacuum the pre-treatment floor until the pervious pavers are visible and clean. **(MWL systems outside of California may or may not have pervious pavers on the floor in the pre-treatment chamber)** If pre-filter cartridges require media replacement, proceed to **Step 4**. If not, replace the access cover(s) and proceed to **Step 7**.

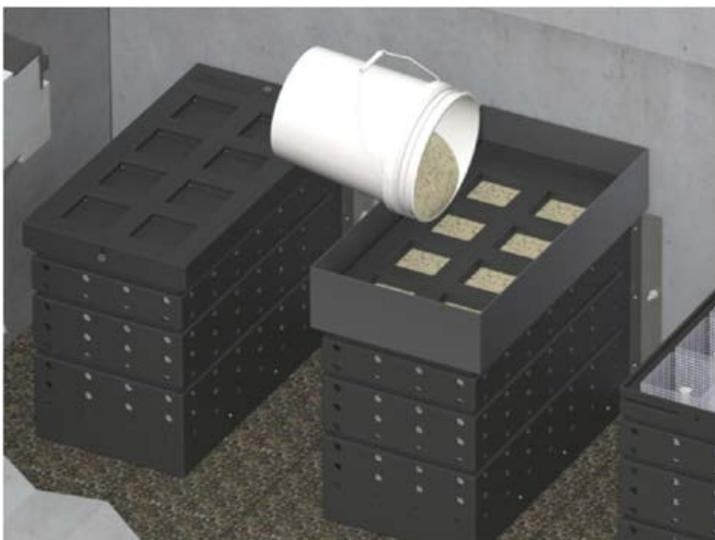

#### 4. PRE-FILTER CARTRIDGE LID REMOVAL

After successfully cleaning out the pre-treatment chamber, enter the chamber and remove the lid(s) from the pre-filter cartridge(s) by removing the two thumb screws. (Older pre-filter cartridges have two bolts holding the lids on that require a 7/16" socket to remove)

#### 5. VACUUM EXISTING PRE-FILTER MEDIA

Utilize the vacuum truck hose or hose extension to remove the filter media from each of the individual media cages. Once filter media has been sucked out, use a pressure washer to spray down the inside of the cartridge and its media cages. Remove cleaned media cages and place to the side. Once removed, the vacuum hose can be inserted into the cartridge to vacuum out any remaining material near the bottom of the cartridge.

#### 6. PRE-FILTER MEDIA REPLACEMENT

Reinstall media cages and fill with new media from the manufacturer or outside supplier. Manufacturer will provide specification of media and sources to purchase. The easiest way to fill the media cages is to utilize a refilling tray that can also be sourced from the manufacturer. Place the refilling tray on top of the cartridge and fill with new bulk media shaking it down into the cages. Using your hands, lightly compact the media into each filter cage. Once the cages are full (each cartridge will hold five heaping 5gal buckets of bulk media), remove the refilling tray and replace the cartridge top, ensuring fasteners are properly tightened.

## 7. MAINTAINING VEGETATION

In general, the biofiltration chamber is maintenance-free with the exception of maintaining the vegetation. The MWL utilizes vegetation similar to surrounding landscape areas, therefore, trim vegetation to match surrounding vegetation. If any plants have died, replace them with new ones.

## 8. INSPECT UNDERDRAIN SYSTEM

Each vertical under drain on the biofiltration chamber has a removable threaded cap that can be taken off to check for any blockages or root growth. Once removed, a jetting attachment to the pressure washer can be used to clean out the under drain and orifice riser if needed.

## 9. REPLACE ACCESS COVERS

Once maintenance is complete, replace all access cover(s)

## REPLACING BIOFILTRATION MEDIA IF REQUIRED

As with all biofilter systems, at some point the biofiltration media will need to be replaced, either due to physical clogging or sorptive exhaustion (for dissolved pollutants) of the media ion exchange capacity (to remove dissolved metals and phosphorous). The general life of this media is 10 to 20 years based on site specific conditions and pollutant loading, so replacing the biofiltration media should not be a common occurrence. In the event that the biofiltration media requires replacement, contact one of Contech's Maintenance Team members at <https://www.conteches.com/maintenance> to order new biofiltration media. The quantity of media needed can be determined by providing the model number and unit depth. Media will be provided in super sacks for easy installation. Each sack will weigh between 1,000 and 2,000 lbs. Biofiltration media replacement can be done following the steps below:

### 1. VACUUM EXISTING BIOFILTRATION MEDIA

Remove the mulch and vegetation to access the biofiltration media, and then position the vacuum truck accordingly. Utilize the vacuum truck to vacuum out all the media. Once all media is removed, use the pressure washer to spray down all the netting and underdrain systems on the inside of the media containment cage. Vacuum out any remaining debris after spraying down netting. Inspect the netting for any damage or holes. If the netting is damaged, it can be repaired or replaced with guidance by the manufacturer.

### 2. INSTALLING NEW BIOFILTRATION MEDIA

Ensure that the chamber is fully cleaned prior to installation of new media into the media containment cage(s). Media will be provided in super sacks for easy installation. A lifting apparatus (forklift, backhoe, boom truck, or other) is recommended to position the super sack over the biofiltration chamber. Add media in lifts to ensure that the riser pipes remain vertical. Be sure to only fill the media cage(s) up to the same level as the old media.

### 3. REPLANT VEGETATION

Once the media has been replaced, replant the vegetation and cover biofiltration chamber with approved mulch (if applicable). If the existing vegetation is not being reused, and new vegetation is being planted, you will need to acquire new plant establishment media that will be installed just below the mulch layer at each plant location. (see plan drawings for details). Contact one of Contech's Maintenance Team members at <https://www.conteches.com/maintenance> to order new plant establishment media.

## REPLACING DRAIN DOWN FILTER MEDIA (ONLY ON OLDER CALIFORNIA MODELS)

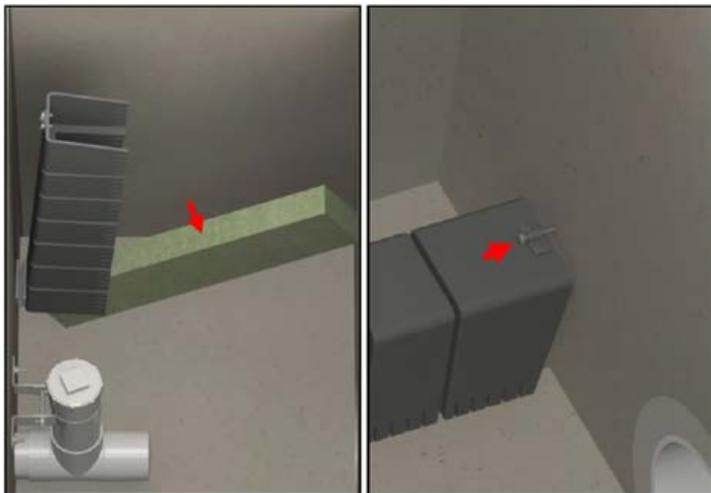

**NOTE: The drain down filter is only found on units installed in California prior to 2023**

If during inspection it was determined that the drain down filter media requires replacement, contact one of Contech's Maintenance Team members at <https://www.conteches.com/maintenance> to order new media.

### 1. REMOVE EXISTING DRAIN DOWN MEDIA

Pull knob back to unlock the locking mechanism and lift the drain down filter housing to remove the used BioMediaGREEN filter block.

### 2. INSTALL NEW DRAIN DOWN MEDIA

Ensure that the chamber and housing are fully cleaned prior to installation of new media, and then insert the new BioMediaGREEN filter block. The media filter block should fit snugly between the chamber walls and be centered under the filter housing. Lower the housing over the filter block and secure the locking mechanism.

### Inspection Checklist

Modular Wetland System Type (Curb, Grate or UG Vault): \_\_\_\_\_ Size (22', 14' or etc.): \_\_\_\_\_

| Structural Integrity:  | Yes | No | Comments       |
|--|-----|----|----------------|
| Damage to pre-treatment access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?  |     |    |                |
| Damage to discharge chamber access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?  |     |    |                |
| Does the MWS unit show signs of structural deterioration (cracks in the wall, damage to frame)?  |     |    |                |
| Is the inlet/outlet pipe or drain down pipe damaged or otherwise not functioning properly?   |     |    |                |
| <b>Working Condition:</b>  |     |    |                |
| Is there evidence of illicit discharge or excessive oil, grease, or other automobile fluids entering and clogging the unit?  |     |    |                |
| Is there standing water in inappropriate areas after a dry period?   |     |    |                |
| Is the filter insert (if applicable) at capacity and/or is there an accumulation of debris/trash on the shelf system?  |     |    |                |
| Does the depth of sediment/trash/debris suggest a blockage of the inflow pipe, bypass or cartridge filter? If yes specify which one in the comments section. Note depth of accumulation in in pre-treatment chamber. |     |    | Depth: _____   |
| Does the cartridge filter media need replacement in pre-treatment chamber and/or discharge chamber?  |     |    | Chamber: _____ |
| Any signs of improper functioning in the discharge chamber? Note issues in comments section.   |     |    |                |
| <b>Other Inspection Items:</b>   |     |    |                |
| Is there an accumulation of sediment/trash/debris in the wetland media (if applicable)?  |     |    |                |
| Is it evident that the plants are alive and healthy (if applicable)? Please note Plant Information below.  |     |    |                |
| Is there a septic or foul odor coming from inside the system?  |     |    |                |

| Waste:                         | Yes | No |
|--------------------------------|-----|----|
| Sediment / Silt / Clay         |     |    |
| Trash / Bags / Bottles         |     |    |
| Green Waste / Leaves / Foliage |     |    |

| Recommended Maintenance         |  |
|---------------------------------|--|
| No Cleaning Needed              |  |
| Schedule Maintenance as Planned |  |
| Needs Immediate Maintenance     |  |

| Plant Information |  |
|-------------------|--|
| Damage to Plants  |  |
| Plant Replacement |  |
| Plant Trimming    |  |

EDUCATIONAL MATERIALS

Support from Orange County residents and businesses is needed to improve water quality and reduce urban runoff pollution. Proper use and disposal of materials will help stop pollution before it reaches the storm drain and the ocean.

Stormwater quality management programs have been developed throughout Orange County to educate and encourage the public to protect water quality, monitor runoff in the storm drain system, investigate illegal dumping and maintain storm drains.

Non-point source pollution can have a serious impact on water quality in Orange County. Pollutants from the storm drain system can harm marine life as well as coastal and wetland habitats. They can also degrade recreation areas such as beaches, harbors and bays.

*The Effect on the Ocean*

- Automotive leaks and spills.
- Improper disposal of used oil and other engine fluids.
- Metals found in vehicle exhaust, weathered paint, rust, metal plating and tires.
- Pesticides and fertilizers from lawns, gardens and farms.
- Improper disposal of cleaners, paint and paint removers.
- Soil erosion and dust debris from landscape and construction activities.
- Litter, lawn clippings, animal waste, and other organic matter.
- Oil stains on parking lots and paved surfaces.

*Sources of Non-Point Source Pollution*

- Anything we use outside homes, vehicles and businesses – like motor oil, paint, pesticides, fertilizers and cleaners – can be blown or washed into storm drains.
- A little water from a garden hose or rain can also send materials into storm drains.
- Storm drains are separate from our sanitary sewer systems; unlike water in sanitary sewers (from sinks or toilets), water in storm drains is not treated before entering our waterways.

*Where Does It Go?*

- Most people believe that the largest source of water pollution in urban areas comes from specific sources such as factories and sewage treatment plants. In fact, the largest source of water pollution comes from city streets, neighborhoods, construction sites and parking lots. This type of pollution is sometimes called “non-point source” pollution.
- There are two types of non-point source pollution: stormwater and urban runoff.
- Stormwater runoff results from rainfall. When rainstorms cause large volumes of water to rinse the urban landscape, picking up pollutants along the way.
- Urban runoff can happen any time of the year when excessive water use from irrigation, vehicle washing and other sources carries trash, lawn clippings and other urban pollutants into storm drains.

*Did You Know?*

*Even if you live miles from the Pacific Ocean, you may be unknowingly polluting it.*

*Dumping one quart of motor oil into a storm drain can contaminate 250,000 gallons of water.*

On-line Water Pollution Problem Reporting Form  
WWW.OCWATERSHEDS.COM

**The Ocean Begins at Your Front Door**

# The Ocean Begins at Your Front Door

*Never allow pollutants to enter the street, gutter or storm drain!*

Follow these simple steps to help reduce water pollution:

## **Household Activities**

- Do not rinse spills with water. Use dry cleanup methods such as applying cat litter or another absorbent material, sweep and dispose of in the trash. Take items such as used or excess batteries, oven cleaners, automotive fluids, painting products and cathode ray tubes, like TVs and computer monitors, to a Household Hazardous Waste Collection Center (HHWCC).
- For a HHWCC near you call (714) 834-6752 or visit [www.oilandfills.com](http://www.oilandfills.com).
- Do not hose down your driveway, sidewalk or patio to the street, gutter or storm drain. Sweep up debris and dispose of it in the trash.

## **Automotive**

- Take your vehicle to a commercial car wash whenever possible. If you wash your vehicle at home, choose soaps, cleaners, or detergents labeled non-toxic, phosphate-free or biodegradable. Vegetable and citrus-based products are typically safest for the environment.
- Do not allow washwater from vehicle washing to drain into the street, gutter or storm drain. Excess washwater should be disposed of in the sanitary sewer (through a sink or toilet) or onto an absorbent surface like your lawn.
- Monitor your vehicles for leaks and place a pan under leaks. Keep your vehicles well maintained to stop and prevent leaks.
- Never pour oil or antifreeze in the street, gutter or storm drain. Recycle these substances at a service station, a waste oil collection center or used oil recycling center. For the nearest Used Oil Collection Center call 1-800-CLEANUP or visit [www.1800cleanup.org](http://www.1800cleanup.org).

## **Pool Maintenance**

- Pool and spa water must be dechlorinated and free of excess acid, alkali or color to be allowed in the street, gutter or storm drain.
- When it is not raining, drain dechlorinated pool and spa water directly into the sanitary sewer.
- Some cities may have ordinances that do not allow pool water to be disposed of in the storm drain. Check with your city.

## **Landscape and Gardening**

- Do not over-water. Water your lawn and garden by hand to control the amount of water you use or set irrigation systems to reflect seasonal water needs. If water flows off your yard onto your driveway or sidewalk, your system is over-watering. Periodically inspect and fix leaks and misdirected sprinklers.
- Do not rake or blow leaves, clippings or pruning waste into the street, gutter or storm drain. Instead, dispose of waste by composting, hauling it to a permitted landfill, or as green waste through your city's recycling program.
- Follow directions on pesticides and fertilizer, (measure, do not estimate amounts) and do not use if rain is predicted within 48 hours.
- Take unwanted pesticides to a HHWCC to be recycled. For locations and hours of HHWCC, call (714) 834-6752 or visit [www.oilandfills.com](http://www.oilandfills.com).

## **Trash**

- Place trash and litter that cannot be recycled in securely covered trash cans.
- Whenever possible, buy recycled products.
- Remember: Reduce, Reuse, Recycle.

## **Pet Care**

- Always pick up after your pet. Flush waste down the toilet or dispose of it in the trash. Pet waste, if left outdoors, can wash into the street, gutter or storm drain.
- If possible, bathe your pets indoors. If you must bathe your pet outside, wash it on your lawn or another absorbent/permeable surface to keep the washwater from entering the street, gutter or storm drain.
- Follow directions for use of pet care products and dispose of any unused products at a HHWCC.

## **Common Pollutants**

### **Home Maintenance**

- Detergents, cleaners and solvents
- Oil and latex paint
- Swimming pool chemicals
- Outdoor trash and litter

### **Lawn and Garden**

- Pet and animal waste
- Pesticides
- Clippings, leaves and soil
- Fertilizer

### **Automobile**

- Oil and grease
- Radiator fluids and antifreeze
- Cleaning chemicals
- Brake pad dust

## The Pollution Solution

Several residential activities can result in water pollution. Among these activities are car washing and hosing off driveways and sidewalks. Both activities can waste water and result in excess runoff. Water conservation methods described in this pamphlet can prevent considerable amounts of runoff and conserve water. By taking your car to a commercial car wash and by sweeping driveways and sidewalks, you can further prevent the transport of pollutants to Orange County waterways. Here are some of the common pollutants for which you can be part of the solution:

### 1 Pesticides and Fertilizer

**Pollution:** The same pesticides that are designed to be toxic to pests can have an equally lethal impact on our marine life. The same fertilizer that promotes plant growth in lawns and gardens can also create nuisance algae blooms, which remove oxygen from the water and clog waterways when it decomposes.

**Solution:** Never use pesticides or fertilizer within 48 hours of an anticipated rainstorm. Use only as much as is directed on the label and keep it off driveways and sidewalks.

### 2 Dirt and Sediment

**Pollution:** Dirt or sediment can impede the flow of the stormwater and negatively impact stream habitat as it travels through waterways and deposits downstream. Pollutants can attach to sediment, which can then be transported through our waterways.

**Solution:** Protect dirt stockpiles by covering them with tarps or secure plastic sheets to prevent wind or rain from allowing dirt or sediment to enter the storm drain system.

### 3 Metals

**Pollution:** Metals and other toxins present in car wash water can harm important plankton, which forms the base of the aquatic food chain.

**Solution:** Take your car to a commercial car wash where the wash water is captured and treated at a local wastewater treatment plant.

#### DID YOU KNOW?

Did you know that most of the pollution found in our waterways is not from a single source, but from a "non-point" source meaning the accumulation of pollution from residents and businesses throughout the community

### 4 Pet Waste

**Pollution:** Pet waste carries bacteria through our watersheds and eventually will be washed out to the ocean. This can pose a health risk to swimmers and surfers.

**Solution:** Pick up after your pets!

### 5 Trash and Debris

**Pollution:** Trash and debris can enter waterways by wind, littering and careless maintenance of trash receptacles. Street sweeping collects some of this trash; however, much of what isn't captured ends up in our storm drain system where it flows untreated out to the ocean.

**Solution:** Don't litter and make sure trash containers are properly covered. It is far more expensive to clean up the litter and trash that ends up in our waterways than it is to prevent it in the first place. Come out to one of Orange County's many locations for Coastal and Inner-Coastal Cleanup Day, which is held in September.

### 6 Motor Oil / Vehicle Fluids

**Pollution:** Oil and petroleum products from our vehicles are toxic to people, wildlife and plants.

**Solution:** Fix any leaks from your vehicle and keep the maintenance up on your car. Use absorbent material such as cat litter on oil spills, then sweep it up and dispose of it in the trash. Recycle used motor oil at a local Household Hazardous Waste Collection Center.

## A TEAM EFFORT

The Orange County Stormwater Program has teamed with the Municipal Water District of Orange County (MWDOC) and the University of California Cooperative Extension Program (UCCE) to develop this pamphlet.

Low Impact Development (LID) and sustainable water use prevents water pollution and conserves water for drinking and reuse. Reducing your water use and the amount of water flowing from your home protects the environment and saves you money.

Thank you for making water protection a priority!

The Ocean Begins at Your Front Door

# RUNOFF, RAINWATER AND REUSE

## Where Does Water Runoff Go?

Stormwater, or water from rainfall events, and runoff from outdoor water use such as sprinklers and hoses flows from homes directly into catch basins and the storm drain system. After entering the storm drain, the water flows untreated into streams, rivers, bays and ultimately the Pacific Ocean. Runoff can come from lawns, gardens, driveways, sidewalks and roofs. As it flows over hard, impervious surfaces, it picks up pollutants. Some pollutants carried by the water runoff include trash, pet waste, pesticides, fertilizer, motor oil and more.

Permeable pavement allows water runoff to infiltrate through the soil and prevents most pollutants from reaching the storm drain system.

## Water Conservation

Pollution not only impairs the water quality for habitat and recreation, it can also reduce the water available for reuse. Runoff allowed to soak into the ground is cleaned as it percolates through the soil, replenishing depleted groundwater supplies. Groundwater provides at least 50% of the total water for drinking and other indoor household activities in north and central Orange County. When land is covered with roads, parking lots, homes, etc., there is less land to take in the water and more hard surfaces over which the water can flow.

In Orange County, 60-70% of water used by residents and businesses goes to irrigation and other outdoor uses. Reusing rainwater to irrigate our lawn not only reduces the impact of water pollution from runoff, but it also is a great way to conserve our precious water resources and replenish our groundwater basin.

## What is Low Impact Development (LID)?

Low Impact Development (LID) is a method of development that seeks to maintain the natural hydrologic character of an area. LID provides a more sustainable and pollution-preventative approach to water management.

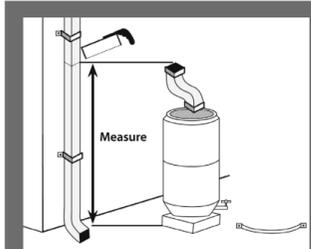

New water quality regulations require implementation of LID in larger new developments and encourage implementation of LID and other sustainable practices in existing residential areas. Implementing modifications to your lawn or garden can reduce pollution in our environment, conserve water and reduce your water bill.

## OPTIONS FOR RAINWATER HARVESTING AND REUSE

Rainwater harvesting is a great way to save money, prevent pollution and reduce potable water use. To harvest your rainwater, simply redirect the runoff from roofs and downspouts to rain barrels. Rain gardens are another option; these reduce runoff as well as encourage infiltration.

### Downspout Disconnection/Redirection

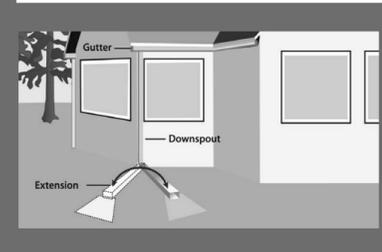

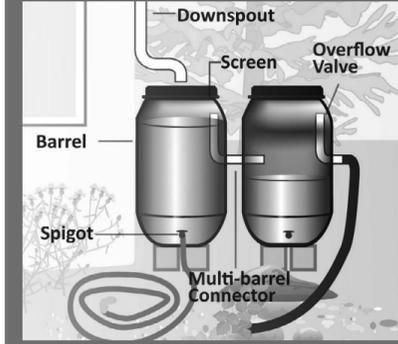

Disconnecting downspouts from pipes running to the gutter prevents runoff from transporting pollutants to the storm drain. Once disconnected, downspouts can be redirected to rain gardens or other vegetated areas, or be connected to a rain barrel.

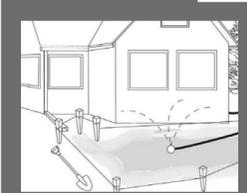

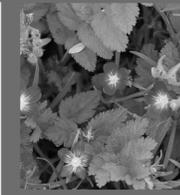

Before modifying your yard to install a rain garden, please consult your local building and/or planning departments to ensure your garden plan follows pertinent building codes and ordinances. Besides codes and ordinances, some home owner associations also have guidelines for yard modifications. If your property is in hill areas or includes engineered slopes, please seek professional advice before proceeding with changes.

### Rain Barrels

Rain barrels capture rainwater flow from roofs for reuse in landscape irrigation. Capacity of rain barrels needed for your home will depend on the amount of roof area and rainfall received. When purchasing your rain barrel, make sure it includes a screen, a spigot to siphon water for use, an overflow tube to allow for excess water to run out and a connector if you wish to connect multiple barrels to add capacity of water storage.

For information on how to disconnect a downspout or to install and maintain a rain barrel or rain garden at your home, please see the Los Angeles Rainwater Harvesting Program, A Homeowner's "How-To" Guide, November 2009 at [www.larainwaterharvesting.org/](http://www.larainwaterharvesting.org/)

Mosquito growth prevention is very important when installing a rain barrel. The best way to prevent mosquito breeding is to eliminate entry points by ensuring all openings are sealed tightly. If these methods are unsuccessful, products are available to kill mosquito larvae, but that are harmless to animals and humans. Regular application of these products is essential. Please visit the Orange County Vector Control website for more information at [www.ocvcd.org/mosquitoes3.php](http://www.ocvcd.org/mosquitoes3.php).

## OTHER WATER CONSERVATION AND POLLUTION PREVENTION TECHNIQUES

### Native Vegetation and Maintenance

"California Friendly" plants or native vegetation can significantly reduce water use. These plants often require far less fertilizers and pesticides, which are two significant pollutants found in Orange County waterways. Replacing water "thirsty" plants and grass types with water efficient natives is a great way to save water and reduce the need for potentially harmful pesticides and fertilizer.

Please see the California Friendly Garden Guide produced by the Metropolitan Water District of Southern California and associated Southern California Water Agencies for a catalog of California friendly plants and other garden resources at [www.bewaterwise.com/Gardensoft](http://www.bewaterwise.com/Gardensoft).

### Weed Free Yards

Weeds are water thieves. They often reproduce quickly and rob your yard of both water and nutrients. Weed your yard by hand if possible. If you use herbicides to control the weeds, use only the amount recommended on the label and never use it if rain is forecast within the next 48 hours.

### Soil Amendments

Soil amendments such as green waste (e.g. grass clippings, compost, etc.) can be a significant source of nutrients and can help keep the soil near the roots of plants moist. However, they can cause algal booms if they get into our waterways, which reduces the amount of oxygen in the water and impacts most aquatic organisms. It is important to apply soil amendments more than 48 hours prior to predicted rainfall.

## IRRIGATE EFFICIENTLY

### Smart Irrigation Controllers

Smart Irrigation Controllers have internal clocks as well as sensors that will turn off the sprinklers in response to environmental changes. If it is raining, too windy or too cold, the smart irrigation control sprinklers will automatically shut off.

Check with your local water agency for available rebates on irrigation controllers and smart timers.

- Aim your sprinklers at your lawn, not the sidewalk – By simply adjusting the direction of your sprinklers you can save water, prevent water pollution from runoff, keep your lawn healthy and save money.
- Set a timer for your sprinklers – lawns absorb the water they need to stay healthy within a few minutes of turning on the sprinklers. Time your sprinklers; when water begins running off your lawn, you can turn them off. Your timer can be set to water your lawn for this duration every time.
- Water at Sunrise – Watering early in the morning will reduce water loss due to evaporation. Additionally, winds tend to die down in the early morning so the water will get to the lawn as intended.
- Water by hand – Instead of using sprinklers, consider watering your yard by hand. Hand-watering ensures that all plants get the proper amount of water and you will prevent any water runoff, which wastes water and carries pollutants into our waterways.
- Fix leaks - Nationwide, households waste one trillion gallons of water a year to leaks – that is enough water to serve the entire state of Texas for a year. If your garden hose is leaking, replace the nylon or rubber hose washer and ensure a tight connection. Fix broken sprinklers immediately.

Water runoff from sprinklers left on too long will carry pollutants into our waterways.

*Do your part to prevent water pollution in our creeks, rivers, bays and ocean.*

Clean beaches and healthy creeks, rivers, bays and ocean are important to Orange County. However, not properly disposing of household hazardous waste can lead to water pollution. Batteries, electronics, paint, oil, gardening chemicals, cleaners and other hazardous materials cannot be thrown in the trash. They also must never be poured or thrown into yards, sidewalks, driveways, gutters or streets. Rain or other water could wash the materials into the storm drain and eventually into our waterways and the ocean. In addition, hazardous waste must not be poured in the sanitary sewers (sinks and toilets).

***NEVER DISPOSE  
OF HOUSEHOLD  
HAZARDOUS  
WASTE IN THE  
TRASH, STREET,  
GUTTER,  
STORM DRAIN  
OR SEWER.***

RECYCLE  
USED OIL

Printed on Recycled Paper

Help Prevent Ocean Pollution:

# Proper Disposal of Household Hazardous Waste

**The Ocean Begins at  
Your Front Door**

**ORANGE COUNTY**

# Pollution Prevention

Leftover household products that contain corrosive, toxic, ignitable, or reactive ingredients are considered to be “household hazardous waste” or “HHW.” HHW can be found throughout your home, including the bathroom, kitchen, laundry room and garage.

*WHEN POSSIBLE,  
USE  
NON-HAZARDOUS  
OR  
LESS-HAZARDOUS  
PRODUCTS.*

Disposal of HHW down the drain, on the ground, into storm drains, or in the trash is illegal and unsafe.

Proper disposal of HHW is actually easy. Simply drop them off at a Household Hazardous Waste Collection Center (HHWCC) for free disposal and recycling. Many materials including anti-freeze, latex-based paint, motor oil and batteries can be recycled. Some centers have a “Stop & Swap” program that lets you take partially used home, garden, and automobile products free of charge. There are four HHWCCs in Orange County:

**Anaheim:**.....1071 N. Blue Gum St  
**Huntington Beach:** ..... 17121 Nichols St  
**Irvine:**..... 6411 Oak Canyon  
**San Juan Capistrano:**.... 32250 La Pata Ave

Centers are open Tuesday-Saturday, 9 a.m.-3 p.m. Centers are closed on rainy days and major holidays. For more information, call (714) 834-6752 or visit [www.oclandfills.com](http://www.oclandfills.com).

## *Common household hazardous wastes*

- Batteries
- Paint and paint products
- Adhesives
- Drain openers
- Household cleaning products
- Wood and metal cleaners and polishes
- Pesticides
- Fungicides/wood preservatives
- Automotive products (antifreeze, motor oil, fluids)
- Grease and rust solvents
- Fluorescent lamps
- Mercury (thermometers & thermostats)
- All forms of electronic waste including computers and microwaves
- Pool & spa chemicals
- Cleaners
- Medications
- Propane (camping & BBQ)
- Mercury-containing lamps

- Television & monitors (CRTs, flatscreens)

## *Tips for household hazardous waste*

- Never dispose of HHW in the trash, street, gutter, storm drain or sewer.
- Keep these materials in closed, labeled containers and store materials indoors or under a cover.
- When possible, use non-hazardous products.
- Reuse products whenever possible or share with family and friends.
- Purchase only as much of a product as you’ll need. Empty containers may be disposed of in the trash.
- HHW can be harmful to humans, pets and the environment. Report emergencies to 911.

***Did you know that just one quart of oil can pollute 250,000 gallons of water?***

A clean ocean and healthy creeks, rivers, bays and beaches are important to Orange County. However, not properly disposing of used oil can lead to water pollution. If you pour or drain oil onto driveways, sidewalks or streets, it can be washed into the storm drain. Unlike water in sanitary sewers (from sinks and toilets), water in storm drains is not treated before entering the ocean. Help prevent water pollution by taking your used oil to a used oil collection center.

Included in this brochure is a list of locations that will accept up to five gallons of used motor oil at no cost. Many also accept used oil filters. Please contact the facility before delivering your used oil. This listing of companies is for your reference and does not constitute a recommendation or endorsement of the company.

Please note that used oil filters may not be disposed of with regular household trash. They must be taken to a household hazardous waste collection or recycling center in Anaheim, Huntington Beach, Irvine or San Juan Capistrano. For information about these centers, visit [www.oilandfills.com](http://www.oilandfills.com).

Please do not mix your oil with other substances!

For more information, please call the Orange County Stormwater Program at 1-877-89-SPILL (1-877-897-7455) or visit [www.watersheds.com](http://www.watersheds.com).

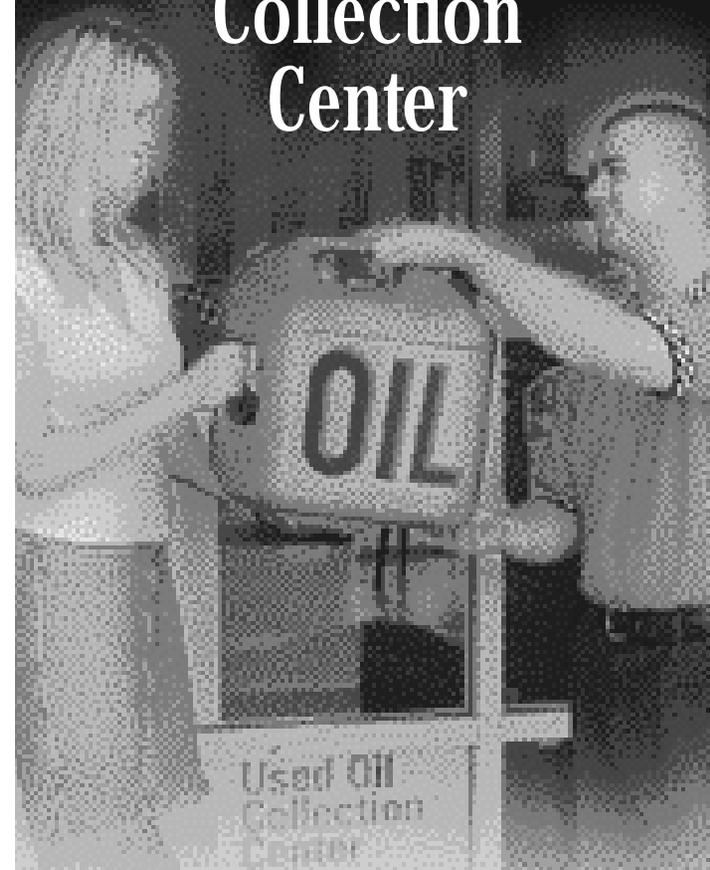

For information about the proper disposal of household hazardous waste, call the Household Waste Hotline at (714) 834-6752 or visit [www.oilandfills.com](http://www.oilandfills.com).

For additional information about the nearest oil recycling center, call the Used Oil Program at 1-800-CLEANUP or visit [www.cleanup.org](http://www.cleanup.org).

**C**lean beaches and healthy creeks, rivers, bays and ocean are important to Orange County. However, many common activities such as pest control can lead to water pollution if you're not careful. Pesticide treatments must be planned and applied properly to ensure that pesticides do not enter the street, gutter or storm drain. Unlike water in sanitary sewers (from sinks and toilets), water in storm drains is not treated before entering our waterways.

You would never dump pesticides into the ocean, so don't let it enter the storm drains. Pesticides can cause significant damage to our environment if used improperly. If you are thinking of using a pesticide to control a pest, there are some important things to consider.

Help Prevent Ocean Pollution:

## Responsible Pest Control

The Ocean Begins  
at Your Front Door

# Tips for Pest Control

## Key Steps to Follow:

**Step 1:** Correctly identify the pest (insect, weed, rodent, or disease) and verify that it is actually causing the problem.

This is important because beneficial insects are often mistaken for pests and sprayed with pesticides needlessly.

Consult with a Certified Nursery Professional at a local nursery or garden center or send a sample of the pest to the Orange County Agricultural Commissioner's Office.

Determine if the pest is still present – even though you see damage, the pest may have left.

**Step 2:** Determine how many pests are present and causing damage.

Small pest populations may be controlled more safely using non-pesticide techniques. These include removing food sources, washing off leaves with a strong stream of water, blocking entry into the home using caulking and replacing problem plants with ones less susceptible to pests.

Integrated Pest Management (IPM) usually combines several least toxic pest control methods for long-term prevention and management of pest problems without harming you, your family, or the environment.

**Step 3:** If a pesticide must be used, choose the least toxic chemical.

Obtain information on the least toxic pesticides that are effective at controlling the target pest from the UC Statewide Integrated Pest Management (IPM) Program's Web site at [www.ipm.ucdavis.edu](http://www.ipm.ucdavis.edu).

Seek out the assistance of a Certified Nursery Professional at a local nursery or garden center when selecting a pesticide. Purchase the smallest amount of pesticide available.

Apply the pesticide to the pest during its most vulnerable life stage. This information can be found on the pesticide label.

**Step 4:** Wear appropriate protective clothing.

Follow pesticide labels regarding specific types of protective equipment you should wear. Protective clothing should always be washed separately from other clothing.

**Step 5:** Continuously monitor external conditions when applying pesticides such as weather, irrigation, and the presence of children and animals.

Never apply pesticides when rain is predicted within the next 48 hours. Also, do not water after applying pesticides unless the directions say it is necessary.

Apply pesticides when the air is still; breezy conditions may cause the spray or dust to drift away from your targeted area.

In case of an emergency call 911 and/or the regional poison control number at (714) 634-5988 or (800) 544-4404 (CA only).

For general questions you may also visit [www.calpoison.org](http://www.calpoison.org).

**Step 6:** In the event of accidental spills, sweep up or use an absorbent agent to remove any excess pesticides. Avoid the use of water.

Be prepared. Have a broom, dust pan, or dry absorbent material, such as cat litter, newspapers or paper towels, ready to assist in cleaning up spills.

Contain and clean up the spill right away. Place contaminated materials in a doubled plastic bag. All materials used to clean up the spill should be properly disposed of according to your local Household Hazardous Waste Disposal site.

**Step 7:** Properly store and dispose of unused pesticides.

Purchase Ready-To-Use (RTU) products to avoid storing large concentrated quantities of pesticides.

Store unused chemicals in a locked cabinet.

Unused pesticide chemicals may be disposed of at a Household Hazardous Waste Collection Center.

Empty pesticide containers should be triple rinsed prior to disposing of them in the trash.

Household Hazardous Waste  
Collection Center  
(714) 834-6752

# Sewage Spill Regulatory Requirements

Allowing sewage to discharge to a gutter or storm drain may subject you to penalties and/or out-of-pocket costs to reimburse cities or public agencies for clean-up efforts.

Here are the pertinent codes, fines, and agency contact information that apply.

## Orange County Stormwater Program

24 Hour Water Pollution Reporting Hotline

1-877-89-SPILL (1-877-897-7455)

- County and city water quality ordinances prohibit discharges containing pollutants.

## Orange County Health Care Agency Environmental Health

(714) 433-6419

California Health and Safety Code, Sections 5410-5416

- No person shall discharge raw or treated sewage or other waste in a manner that results in contamination, pollution or a nuisance.
- Any person who causes or permits a sewage discharge to any state waters:
  - must immediately notify the local health agency of the discharge.
  - shall reimburse the local health agency for services that protect the public's health and safety (water-contact receiving waters).
  - who fails to provide the required notice to the local health agency is guilty of a misdemeanor and shall be punished by a fine (between \$500-\$1,000) and/or imprisonment for less than one year.

## Regional Water Quality Control Board Santa Ana Region San Diego Region

(951) 782-4130

(858) 467-2952

- Requires the prevention, mitigation, response to and reporting of sewage spills.

## California Office of Emergency Services

(800) 852-7550

California Water Code, Article 4, Chapter 4, Sections 13268-13271  
California Code of Regulations, Title 23, Division 3, Chapter 9.2, Article 2, Sections 2250-2260

- Any person who causes or permits sewage in excess of 1,000 gallons to be discharged to state waters shall immediately notify the Office of Emergency Services.
- Any person who fails to provide the notice required by this section is guilty of a misdemeanor and shall be punished by a fine (less than \$20,000) and/or imprisonment for not more than one year.

# What is a Sewage Spill?

Sewage spills occur when the wastewater being transported via underground pipes overflows through a manhole, cleanout or broken pipe. Sewage spills can cause health hazards, damage to homes and businesses, and threaten the environment, local waterways and beaches.

## Common Causes of Sewage Spills

**Grease** builds up inside and eventually blocks sewer pipes. Grease gets into the sewer from food establishments, household drains, as well as from poorly maintained commercial grease traps and interceptors.

**Structure problems** caused by tree roots in the lines, broken/cracked pipes, missing or broken cleanout caps or undersized sewers can cause blockages.

**Infiltration and inflow (I/I)** impacts pipe capacity and is caused when groundwater or rainwater enters the sewer system through pipe defects and illegal connections.

## You Are Responsible for a Sewage Spill Caused by a Blockage or Break in Your Sewer Lines!

Time is of the essence in dealing with sewage spills. You are required to **immediately**:

**Control and minimize the spill.** Keep spills contained on private property and out of gutters, storm drains and public waterways by shutting off or not using the water.

**Use sandbags, dirt and/or plastic sheeting** to prevent sewage from entering the storm drain system.

**Clear the sewer blockage.** Always wear gloves and wash your hands. It is recommended that a plumbing professional be called for clearing blockages and making necessary repairs.

**Always notify your city sewer/public works department or public sewer district of sewage spills.** If the spill enters the storm drains also notify the Health Care Agency. In addition, if it exceeds 1,000 gallons notify the Office of Emergency Services. Refer to the numbers listed in this brochure.

Overflowing  
cleanout pipe  
located on  
private property

## You Could Be Liable

Allowing sewage from your home, business or property to discharge to a gutter or storm drain may subject you to penalties and/or out-of-pocket costs to reimburse cities or public agencies for clean-up and enforcement efforts. See Regulatory Codes & Fines section for pertinent codes and fines that apply.

## What to Look For

Sewage spills can be a very noticeable gushing of water from a manhole or a slow water leak that may take time to be noticed. Don't dismiss unaccounted-for wet areas.

Look for:

- Drain backups inside the building.
- Wet ground and water leaking around manhole lids onto your street.
- Leaking water from cleanouts or outside drains.
- Unusual odorous wet areas: sidewalks, external walls or ground/landscape around a building.

## Caution

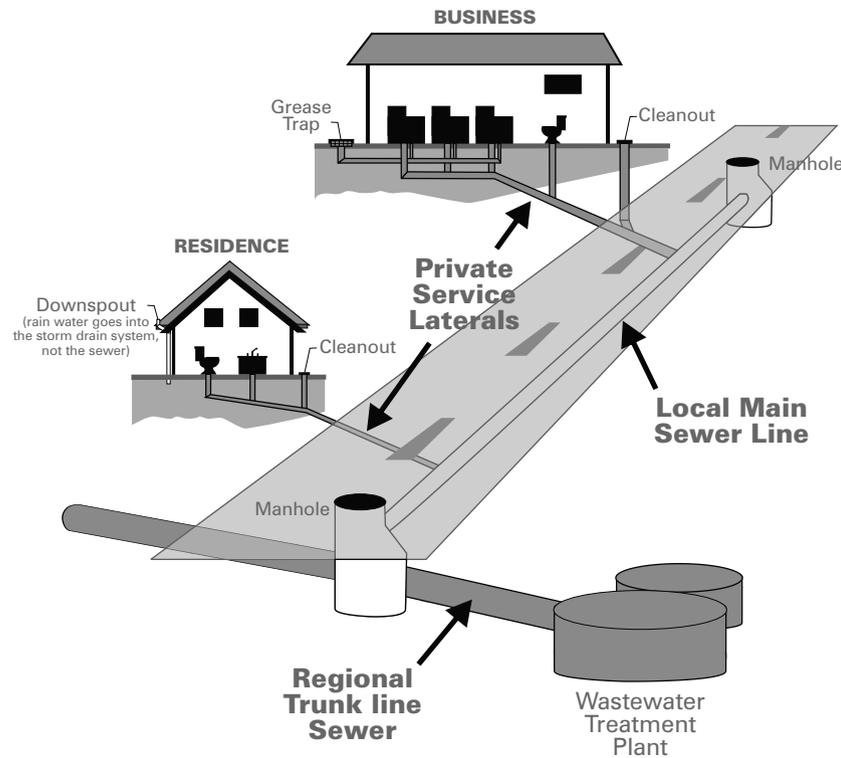

Keep people and pets away from the affected area. Untreated sewage has high levels of disease-causing viruses and bacteria. Call your local health care agency listed on the back for more information.

**If You See a Sewage Spill Occurring,  
Notify Your City Sewer/Public Works  
Department or Public Sewer District  
IMMEDIATELY!**

# How a Sewer System Works

A property owner's sewer pipes are called service laterals and are connected to larger local main and regional trunk lines. Service laterals run from the connection at the home to the connection with the public sewer (including the area under the street). These laterals are the responsibility of the property owner and must be maintained by the property owner. Many city agencies have adopted ordinances requiring maintenance of service laterals. Check with your city sewer/local public works department for more information.

Operation and maintenance of **local and regional sewer lines** are the responsibility of the city sewer/public works departments and public sewer districts.

## Preventing Grease Blockages

The drain is not a dump! Recycle or dispose of grease properly and never pour grease down the drain.

Homeowners should mix fats, oils and grease with absorbent waste materials such as paper, coffee grounds, or kitty litter and place it in the trash. Wipe food scraps from plates and pans and dump them in the trash.

Restaurants and commercial food service establishments should always use "Kitchen Best Management Practices." These include:

- Collecting all cooking grease and liquid oil from pots, pans and fryers in covered grease containers for recycling.
- Scraping or dry-wiping excess food and grease from dishes, pots, pans and fryers into the trash.
- Installing drain screens on all kitchen drains.
- Having spill kits readily available for cleaning up spills.
- Properly maintaining grease traps or interceptors by having them serviced regularly. Check your local city codes.

## How You Can Prevent Sewage Spills

- 1 Never put grease down garbage disposals, drains or toilets.**
- 2 Perform periodic cleaning to eliminate grease, debris and roots in your service laterals.**
- 3 Repair any structural problems in your sewer system and eliminate any rainwater infiltration/inflow leaks into your service laterals.**

# Orange County Agency Responsibilities

- **City Sewer/Public Works Departments**— Responsible for protecting city property and streets, the local storm drain system, sewage collection system and other public areas.
- **Public Sewer/Sanitation District**— Responsible for collecting, treating and disposing of wastewater.
- **County of Orange Health Care Agency**— Responsible for protecting public health by closing ocean/bay waters and may close food-service businesses if a spill poses a threat to public health.
- **Regional Water Quality Control Boards**— Responsible for protecting State waters.
- **Orange County Stormwater Program**— Responsible for preventing harmful pollutants from being discharged or washed by stormwater runoff into the municipal storm drain system, creeks, bays and the ocean.

## You Could Be Liable for Not Protecting the Environment

Local and state agencies have legal jurisdiction and enforcement authority to ensure that sewage spills are remedied.

They may respond and assist with containment, relieving pipe blockages, and/or clean-up of the sewage spill, especially if the spill is flowing into storm drains or onto public property.

**A property owner may be charged for costs incurred by these agencies responding to spills from private properties.**

# Report Sewage Spills!

| Office of Emergency Services     | (800) 852-7550 |

**C**lean beaches and healthy creeks, rivers, bays and ocean are important to Orange County. However, many common activities can lead to water pollution if you're not careful. Home improvement projects and work sites must be maintained to ensure that building materials do not enter the street, gutter or storm drain. Unlike water in sanitary sewers (from sinks and toilets), water in storm drains is not treated before entering our waterways.

You would never dump building materials into the ocean, so don't let them enter the storm drains. Follow these tips to help prevent water pollution.

For more information, please call the **Orange County Stormwater Program** at **1-877-89-SPILL** (1-877-897-7455) or visit [www.ocwatersheds.com](http://www.ocwatersheds.com)

To report a spill, call the **Orange County 24-Hour Water Pollution Problem Reporting Hotline** at **1-877-89-SPILL** (1-877-897-7455).

**For emergencies, dial 911.**

The tips contained in this brochure provide useful information to help prevent water pollution while performing home improvement projects. If you have other suggestions, please contact your city's stormwater representatives or call the Orange County Stormwater Program.

## Help Prevent Ocean Pollution: Tips for Home Improvement Projects

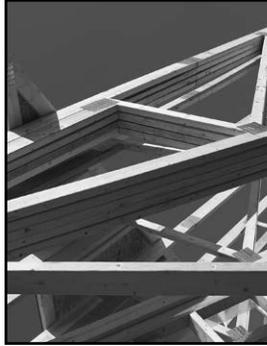

# Tips for Home Improvement Projects

Home improvement projects can cause significant damage to the environment. Whether you hire a contractor or work on the house yourself, it is important to follow these simple tips while renovating, remodeling or improving your home:

## General Construction

- Schedule projects for dry weather.
- Keep all construction debris away from the street, gutter and storm drain.
- Store materials under cover with temporary roofs or plastic sheets to eliminate or reduce the possibility that rainfall, runoff or wind will carry materials from the project site to the street, storm drain or adjacent properties.

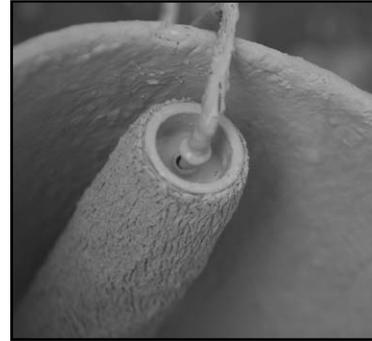

## Building Materials

- Never hose materials into a street, gutter or storm drain.
- Exposed piles of construction material should not be stored on the street or sidewalk.
- Minimize waste by ordering only the amount of materials needed to complete the job.
- Do not mix more fresh concrete than is needed for each project.
- Wash concrete mixers and equipment in a designated washout area where the water can flow into a containment area or onto dirt.
- Dispose of small amounts of dry excess materials in the trash. Powdery waste, such as dry concrete, must be properly contained within a box or bag prior to disposal. Call your local trash hauler for weight and size limits.

## Paint

- Measure the room or object to be painted, then buy only the amount needed.
- Place the lid on firmly and store the paint can upside-down in a dry location away from the elements.
- Tools such as brushes, buckets and rags should never be washed where excess water can drain into the street, gutter or storm drain. All tools should be rinsed in a sink connected to the sanitary sewer.
- When disposing of paint, never put wet paint in the trash.
- Dispose of water-based paint by removing the lid and letting it dry in the can. Large amounts must be taken to a Household Hazardous Waste Collection Center (HHWCC).
- Oil-based paint is a household hazardous waste. All leftover paint should be taken to a HHWCC.
- For HHWCC locations and hours, call (714) 834-6752 or visit [www.oilandfills.com](http://www.oilandfills.com).

## Erosion Control

- Schedule grading and excavation projects for dry weather.
- When temporarily removing soil, pile it in a contained, covered area where it cannot spill into the street, or obtain the required temporary encroachment or street closure permit and follow the conditions instructed by the permit.

- When permanently removing large quantities of soil, a disposal location must be found prior to excavation. Numerous businesses are available to handle disposal needs. For disposal options, visit [www.ciwmb.ca.gov/SWIS](http://www.ciwmb.ca.gov/SWIS).
- Prevent erosion by planting fast-growing annual and perennial grasses. They will shield and bind the soil.

## Recycle

- Use a construction and demolition recycling company to recycle lumber, paper, cardboard, metals, masonry (bricks, concrete, etc.), carpet, plastic, pipes (plastic, metal and clay), drywall, rocks, dirt and green waste.
- For a listing of construction and demolition recycling locations in your area, visit [www.ciwmb.ca.gov/recycle](http://www.ciwmb.ca.gov/recycle).

## Spills

- Clean up spills immediately by using an absorbent material such as cat litter, then sweep it up and dispose of it in the trash.
- Immediately report spills that have entered the street, gutter or storm drain to the County's 24-Hour Water Pollution Problem Reporting Hotline at (714) 567-6363 or visit [www.ocwatersheds.com](http://www.ocwatersheds.com) to fill out an incident reporting form.

**C**lean beaches and healthy creeks, rivers, bays and ocean are important to Orange County. However, many common activities can lead to water pollution if you're not careful. Fertilizers, pesticides and other chemicals that are left on yards or driveways can be blown or washed into storm drains that flow to the ocean. Overwatering lawns can also send materials into storm drains. Unlike water in sanitary sewers (from sinks and toilets), water in storm drains is not treated before entering our waterways.

You would never pour gardening products into the ocean, so don't let them enter the storm drains. Follow these easy tips to help prevent water pollution.

For more information, please call the **Orange County Stormwater Program** at **1-877-89-SPILL** (1-877-897-7455) or visit [www.ocwatersheds.com](http://www.ocwatersheds.com)

**UCCE Master Gardener Hotline:**  
**(714) 708-1646**

To report a spill, call the **Orange County 24-Hour Water Pollution Problem Reporting Hotline** **1-877-89-SPILL** (1-877-897-7455).

**For emergencies, dial 911.**

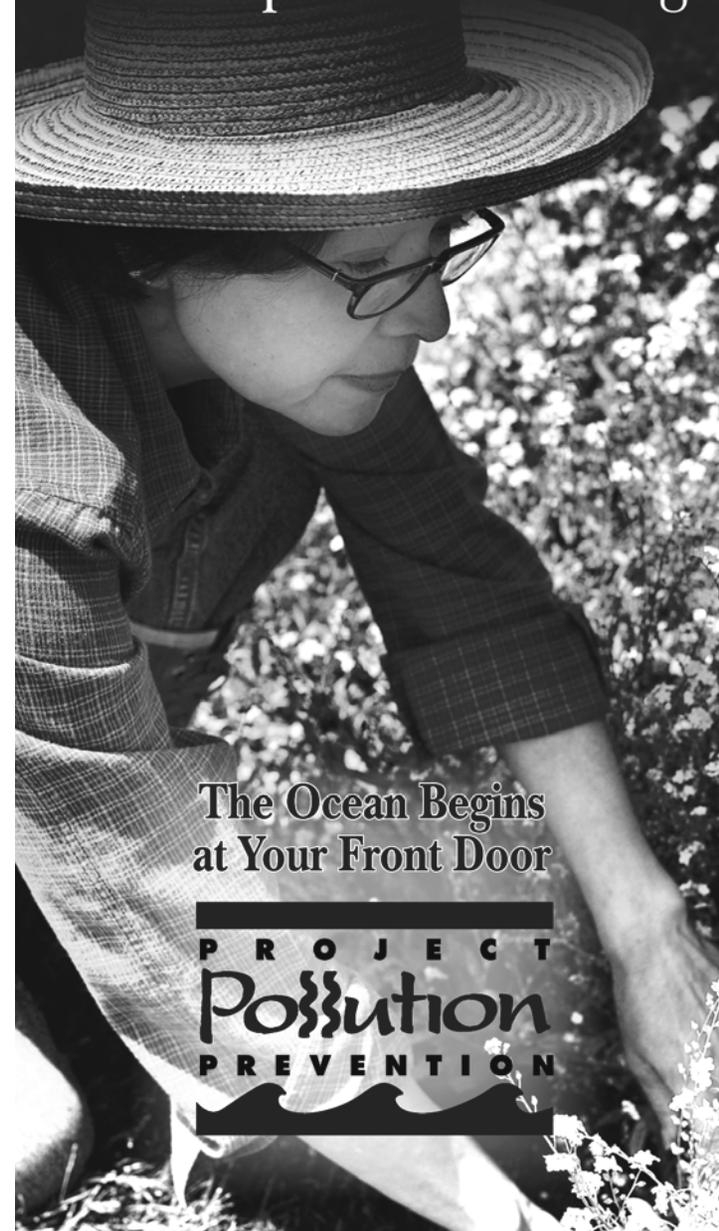

The tips contained in this brochure provide useful information to help prevent water pollution while landscaping or gardening. If you have other suggestions, please contact your city's stormwater representatives or call the Orange County Stormwater Program.

Help Prevent Ocean Pollution:

## Tips for Landscape & Gardening

The Ocean Begins  
at Your Front Door

# Tips for Landscape & Gardening

Never allow gardening products or polluted water to enter the street, gutter or storm drain.

## *General Landscaping Tips*

- Protect stockpiles and materials from wind and rain by storing them under tarps or secured plastic sheeting.
- Prevent erosion of slopes by planting fast-growing, dense ground covering plants. These will shield and bind the soil.
- Plant native vegetation to reduce the amount of water, fertilizers, and pesticide applied to the landscape.
- Never apply pesticides or fertilizers when rain is predicted within the next 48 hours.

## *Garden & Lawn Maintenance*

- Do not overwater. Use irrigation practices such as drip irrigation, soaker hoses or micro spray systems. Periodically inspect and fix leaks and misdirected sprinklers.

- Do not rake or blow leaves, clippings or pruning waste into the street, gutter or storm drain. Instead, dispose of green waste by composting, hauling it to a permitted landfill, or recycling it through your city's program.

- Use slow-release fertilizers to minimize leaching, and use organic fertilizers.
- Read labels and use only as directed. Do not over-apply pesticides or fertilizers. Apply to spots as needed, rather than blanketing an entire area.
- Store pesticides, fertilizers and other chemicals in a dry covered area to prevent exposure that may result in the deterioration of containers and packaging.
- Rinse empty pesticide containers and re-use rinse water as you would use the

product. Do not dump rinse water down storm drains. Dispose of empty containers in the trash.

- When available, use non-toxic alternatives to traditional pesticides, and use pesticides specifically designed to control the pest you are targeting. For more information, visit [www.ipm.ucdavis.edu](http://www.ipm.ucdavis.edu).
- If fertilizer is spilled, sweep up the spill before irrigating. If the spill is liquid, apply an absorbent material such as cat litter, and then sweep it up and dispose of it in the trash.
- Take unwanted pesticides to a Household Hazardous Waste Collection Center to be recycled. Locations are provided below.

## Household Hazardous Waste Collection Centers

Anaheim: 1071 N. Blue Gum St.  
Huntington Beach: 17121 Nichols St.  
Irvine: 6411 Oak Canyon  
San Juan Capistrano: 32250 La Pata Ave.

For more information, call (714) 834-6752 or visit [www.oilandfills.com](http://www.oilandfills.com)

**C**lean beaches and healthy creeks, rivers, bays and ocean are important to Orange County. However, many common activities can lead to water pollution if you're not careful. Pet waste and pet care products can be washed into the storm drains that flow to the ocean. Unlike water in sanitary sewers (from sinks and toilets), water in storm drains is not treated before entering our waterways.

You would never put pet waste or pet care products into the ocean, so don't let them enter the storm drains. Follow these easy tips to help prevent water pollution.

For more information, please call the **Orange County Stormwater Program** at **1-877-89-SPILL** (1-877-897-7455) or visit **www.ocwatersheds.com**

To report a spill, call the **Orange County 24-Hour Water Pollution Problem Reporting Hotline** **1-877-89-SPILL** (1-877-897-7455).

**For emergencies, dial 911.**

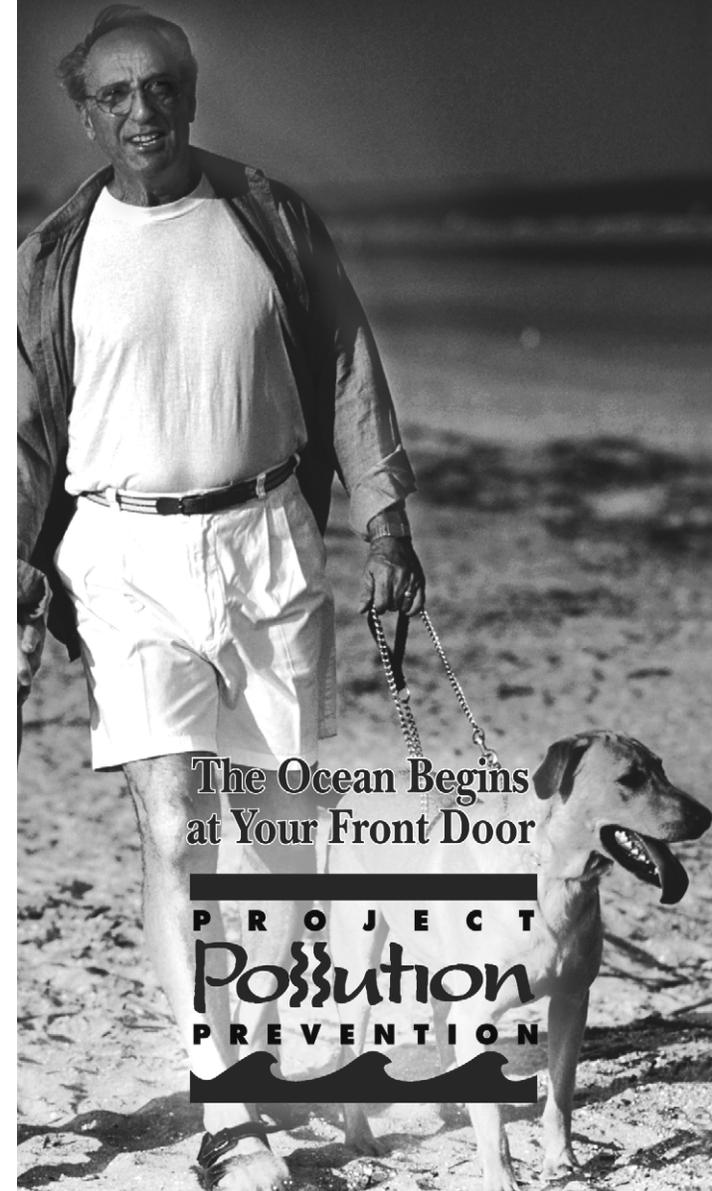

The tips contained in this brochure provide useful information to help prevent water pollution while caring for your pet. If you have other suggestions, please contact your city's stormwater representatives or call the Orange County Stormwater Program.

Help Prevent Ocean Pollution:

## Tips for Pet Care

The Ocean Begins  
at Your Front Door

**P R O J E C T**  
**Pollution**  
**P R E V E N T I O N**

# Tips for Pet Care

Never let any pet care products or washwater run off your yard and into the street, gutter or storm drain.

## *Washing Your Pets*

Even biodegradable soaps and shampoos can be harmful to marine life and the environment.

- If possible, bathe your pets indoors using less-toxic shampoos or have your pet professionally groomed. Follow instructions on the products and clean up spills.
- If you bathe your pet outside, wash it on your lawn or another absorbent/permeable surface to keep the washwater from running into the street, gutter or storm drain.

## *Flea Control*

- Consider using oral or topical flea control products.
- If you use flea control products such as shampoos, sprays or collars, make sure to dispose of any unused products at a Household Hazardous Waste Collection Center. For location information, call (714) 834-6752.

## *Why You Should Pick Up After Your Pet*

It's the law! Every city has an ordinance requiring you to pick up after your pet. Besides being a nuisance, pet

waste can lead to water pollution, even if you live inland. During rainfall, pet waste left outdoors can wash into storm drains. This waste flows directly into our waterways and the ocean where it can harm human health, marine life and the environment.

As it decomposes, pet waste demands a high level of oxygen from water. This decomposition can contribute to killing marine life by reducing the amount of dissolved oxygen available to them.

Have fun with your pets, but please be a responsible pet owner by taking care of them and the environment.

- Take a bag with you on walks to pick up after your pet.
- Dispose of the waste in the trash or in a toilet.

**C**lean beaches and healthy creeks, rivers, bays and ocean are important to Orange County. However, many common activities such as painting can lead to water pollution if you're not careful. Paint must be used, stored and disposed of properly to ensure that it does not enter the street, gutter or storm drain. Unlike water in sanitary sewers (from sinks and toilets), water in storm drains is not treated before entering our waterways.

You would never dump paint into the ocean, so don't let it enter the storm drains. Follow these easy tips to help prevent water pollution.

For more information, please call the **Orange County Stormwater Program** at **1-877-89-SPILL** (1-877-897-7455) or visit [www.ocwatersheds.com](http://www.ocwatersheds.com)

To report a spill, call the **Orange County 24-Hour Water Pollution Problem Reporting Hotline** at **1-877-89-SPILL** (1-877-897-7455).

**For emergencies, dial 911.**

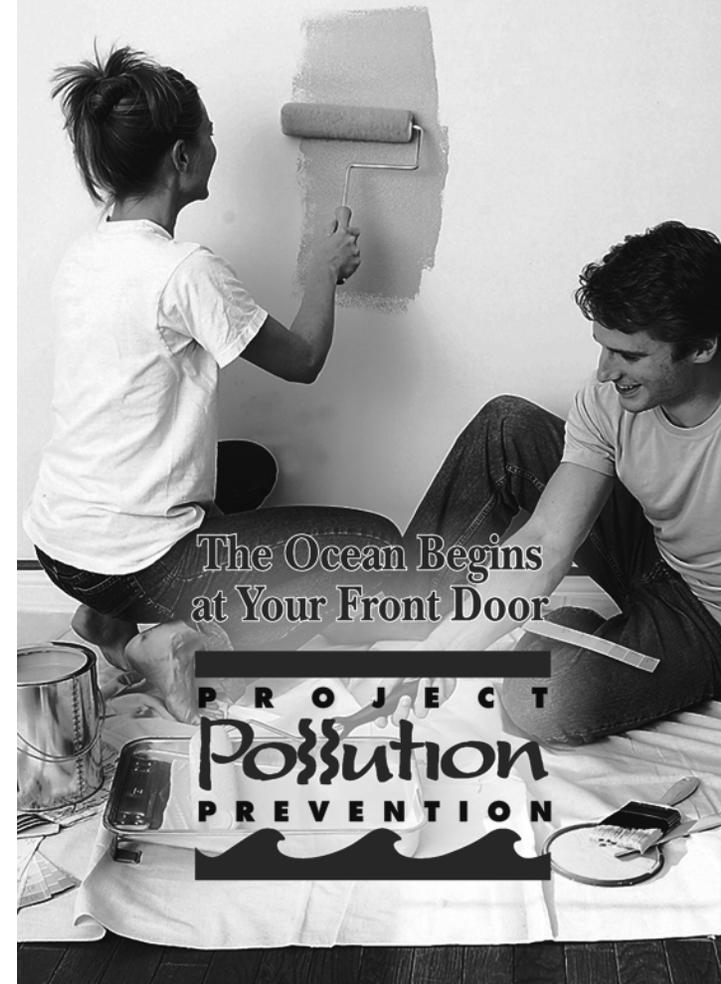

The tips contained in this brochure provide useful information to help prevent water pollution while using, storing and disposing of paint. If you have other suggestions, please contact your city's stormwater representatives or call the Orange County Stormwater Program.

Help Prevent Ocean Pollution:

## Tips for Projects Using Paint

# Tips for Projects Using Paint

Paint can cause significant damage to our environment. Whether you hire a contractor or do it yourself, it is important to follow these simple tips when purchasing, using, cleaning, storing and disposing of paint.

## *Purchasing Paint*

- Measure the room or object to be painted, then buy only the amount needed.
- Whenever possible, use water-based paint since it usually does not require hazardous solvents such as paint thinner for cleanup.

## *Painting*

- Use only one brush or roller per color of paint to reduce the amount of water needed for cleaning.
- Place open paint containers or trays on a stable surface and in a position that is unlikely to spill.
- Always use a tarp under the area or object being painted to collect paint drips and contain spills.

## *Cleaning*

- Never clean brushes or rinse paint containers in the street, gutter or storm drain.
- For oil-based products, use as much of the paint on the brushes as possible. Clean brushes with thinner. To reuse thinner, pour it through a fine filter (e.g. nylon, metal gauze or filter paper) to remove solids such as leftover traces of paint.
- For water-based products, use as much of the paint on the brushes as possible, then rinse in the sink.
- Collect all paint chips and dust. Chips and dust from marine paints or paints containing lead, mercury or tributyl tin are hazardous waste. Sweep up and dispose of at a Household Hazardous Waste Collection Center (HHWCC).

## *Storing Paint*

- Store paint in a dry location away from the elements.
- Store leftover water-based paint, oil-based paint and solvents separately in original or clearly marked containers.
- Avoid storing paint cans directly on cement floors. The bottom of the can will rust much faster on cement.
- Place the lid on firmly and store the paint can upside-down to prevent air from entering. This will keep the paint usable longer. Oil-based paint is usable for up to 15 years. Water-based paint remains usable for up to 10 years.

## *Alternatives to Disposal*

- Use excess paint to apply another coat, for touch-ups, or to paint a closet, garage, basement or attic.
- Give extra paint to friends or family. Extra paint can also be donated to a local theatre group, low-income housing program or school.
- Take extra paint to an exchange program such as the “**Stop & Swap**” that allows you to drop off or pick up partially used home care products free of charge. “**Stop & Swap**” programs are available at most HHWCCs.
- For HHWCC locations and hours, call (714) 834-6752 or visit [www.oilandfills.com](http://www.oilandfills.com).

## *Disposing of Paint*

- Never put wet paint in the trash.

### *For water-based paint:*

- If possible, brush the leftover paint on cardboard or newspaper. Otherwise, allow the paint to dry in the can with the lid off in a well-ventilated area protected from the elements, children and pets. Stirring the paint every few days will speed up the drying.
- Large quantities of extra paint should be taken to a HHWCC.
- Once dried, paint and painted surfaces may be disposed of in the trash. When setting a dried paint can out for trash collection, leave the lid off so the collector will see that the paint has dried.

### *For oil-based paint:*

- Oil-based paint is a household hazardous waste. All leftover paint should be taken to a HHWCC.

### *Aerosol paint:*

- Dispose of aerosol paint cans at a HHWCC.

## *Spills*

- Never hose down pavement or other impermeable surfaces where paint has spilled.
- Clean up spills immediately by using an absorbent material such as cat litter. Cat litter used to clean water-based paint spills can be disposed of in the trash. When cleaning oil-based paint spills with cat litter, it must be taken to a HHWCC.
- Immediately report spills that have entered the street, gutter or storm drain to the County's 24-Hour Water Pollution Problem Reporting Hotline at (714) 567-6363 or visit [www.ocwatersheds.com](http://www.ocwatersheds.com) to fill out an incident reporting form.

**PRELIMINARY GEOTECHNICAL EVALAUTION**  
**Mill Creek Drive and Ridge Route Drive**  
**Laguna Hills, California**

**EXECUTIVE SUMMARY**

Langan Engineering and Environmental Services has performed a preliminary geotechnical evaluation for the proposed residential development located in Laguna Hills, California. The approximately 16 acre site is bound by Mill Creek Drive to the west, Ridge Route Drive to the south, the lower portion of the downhill slope to the Veeh Reservoir to the east, and office buildings to the northwest. The proposed development consists of four 6-story apartment buildings, with each apartment building wrapped around a 6- to 7-level parking structure. The project will also include a park, surface parking, and other improvements. All proposed structures are planned to be at-grade.

A portion of the proposed development is within the FEMA Zone A, defined as a having a "1% Annual Chance Flood Hazard without base flood elevation" Therefore, we recommend that the project civil engineer confirm the base flood elevation during design and that the site grades meet the requirement to accommodate the base flood elevation including any required freeboard.

The subsurface conditions beneath the northern portion of the project site generally consist of shallow bedrock of the Sespe formation (Ts). In general, the existing Sespe formation (Ts) is considered suitable for support of the proposed structures and other improvements.

The subsurface conditions encountered during our exploration in southern portion of the site include a variable thickness of fill or residual soil over Sespe formation bedrock. Considering the nature of the proposed construction and the subsurface conditions within the site, we recommend shallow foundations for the proposed apartment buildings and parking structures. However, the use of shallow foundations in areas of fill and residual soil could require the overexcavations and recompaction of the fill and residual soil or other ground improvement. The quality and lateral extents of the fill should be characterized further as part of a design-level geotechnical investigation.

On the basis of the soluble sulfate percent, concrete can be designed as exposure class S0 for sulfate exposure. Per ACI 318-A, a minimum specified compressive strength ( $f'c$ ) of 2,500 pounds per square inch (psi) may be used for foundation element and slabs (ASTM C150). A corrosion expert should be consulted during the design phase for the most economical and effective corrosion protection if ferrous site utilities are required.

The Site is in a seismically active region. The closest fault is approximately 3.5 miles away. The site is not located within a currently established Alquist-Priolo Earthquake Study Zone. The California Building Code should be followed with respect to seismic design.

Table 1 summarizes our preliminary recommendations.

**TABLE 1**  
**SUMMARY OF PRELIMINARY RECOMMENDATIONS FOR**  
**PROPOSED DEVELOPMENT**

| Design Item  | Recommended Design Parameter   |
|--|--|
| Shallow Foundations                                      |  |
| Allowable Bearing Pressure<br>(for dead plus live loads) | 2,500 to 4,500 psf<br>(see Section 6.5.1 for recommendation<br>where footings will span cut-fill<br>transitions)   |
| Minimum Footing Width                                    | 12 inches  |
| Minimum Footing Embedment                                | 24 inches or, where closer than 15 to 20<br>feet from the top of the slope, deepened<br>so that distance to daylight meets the<br>setback requirement (see Section 6.5.1)          |
| Minimum Reinforcement                                    | Structural engineer to design for medium<br>expansion potential  |
| Seismic Design Class                                     | Site Class D<br>(additional future testing could support<br>Site Class C for some buildings)   |
| PROJECT SITE CONDITIONS:                                 |  |
| Expansive Nature of Site Soils                           | Medium potential   |
| Liquefaction Potential                                   | Low potential  |
| Corrosion Consideration                                  | Sulfate exposure S0  |
| Groundwater Depth  | Groundwater was not encountered to<br>the maximum depth explored of<br>approximately 31 feet below existing<br>ground surface (corresponding to<br>approximate elevation 297 feet) |
| Design Groundwater Elevation                             | Design Groundwater Elevation 286 feet<br>(NAVD88 <sup>1</sup> vertical datum)  |

**PRELIMINARY GEOTECHNICAL EVALAUTION**  
**Mill Creek Drive and Ridge Route Drive**  
**Laguna Hills, California**

## **1.0 INTRODUCTION**

As requested, and in accordance with our 2 February 2023 proposal and subsequent authorization by Kingsbarn Realty Capital, LLC, we have completed a preliminary geotechnical investigation for the proposed Mill Creek Drive Apartments located at Mill Creek Drive and Ridge Route Drive in Laguna Hills, Orange County, California (the Site). The purposes of this report are (1) to summarize our understanding of the geological and geotechnical aspects of the Site, (2) to document existing site conditions; (3) to summarize our subsurface investigation and findings; and (4) to provide preliminary geotechnical recommendations for the proposed future development. Recommendations provided herein are in accordance with the 2022 California Building Code (2022 CBC) and the City of Laguna Hills Municipal Code.

## **2.0 PROJECT DESCRIPTION**

### **2.1 Existing Conditions**

The proposed development is located at the northeast corner of Mill Creek Drive and Ridge Route Drive in Laguna Hills, CA. The approximately 16-acre site is on Orange County Assessor Tax Number (APNs) 588-161-06 to 588-161-10, 588-161-12, 588-161-13. The site is bound by Mill Creek Drive to the west, Ridge Route Drive to the south, the lower portion of the downhill slope to the Veeh Reservoir to the east, and existing development to the north as shown on Figure 1, Site Location Map.

Ground surface elevations at the site range from approximate elevation 345 feet<sup>2</sup> to elevation 318 feet, sloping downward toward the south. The northeast portion of the property slopes downward towards the water line of the Veeh Reservoir to the northeast with a maximum height of approximately 60 feet (as measured from the top of slope to the water line of the reservoir shown in the topographic plan provided by Fuscoe Engineering, the project civil engineer) and a slope of approximately 1:1 to 3½:1 (horizontal to vertical).

---

<sup>2</sup> Elevations referenced to NAVD88 vertical datum based on topographic plan titled "Basemap of 23272 & 23282 Mill Creek Drive, Laguna Hills, California" by Fuscoe Engineering dated 19 April 2023.

## **2.2 Proposed Development**

Our understanding of the proposed project is based on a concept site plan dated 12 January 2023<sup>3</sup>. According to the conceptual site plan, we understand Kingsbarn Realty Capital plans to redevelop the site in multiple phases with four 6-story apartment buildings (total of 1,200 apartments), designated as Building 1 to Building 4. Each apartment building will be wrapped around a 6 to 7-level parking structure, which will provide a total of 2,100 parking spaces. All of the structures are planned to be at-grade. The project will also include a park, surface parking, a paseo/fire access lane, and other improvements.

According to correspondence with Fuscoe Engineering received 27 March 2023, the project civil engineer, we understand that, on a preliminary basis, proposed grades will be matched to existing grades and that cuts and fills to the existing building pads will likely be minimal. However, a portion of proposed Building 4 as well as a section of the paseo/fire access lane appears to extend north of the limits of the current building and parking lot pad and, assuming a pad and finished pavement subgrade elevation of approximate el. 345 feet, will require up to 45 feet of new fill to be placed.

## **3.0 AVAILABLE INFORMATION REVIEW**

Information that Langan reviewed included reports, maps, and other publicly available information from the United States Geological Survey (USGS), California Geological Survey (CGS), Orange County, Federal Emergency Management Agency (FEMA), California Geologic Energy Management Division (CalGEM), Groundwater Ambient Monitoring and Assessment Program (GAMA), the City of Laguna Hills, and data from our files.

A summary of the available information reviewed is provided in the sections below.

### **3.1 Regional and Local Geology**

The site is located in Southern California in the Peninsular Ranges geomorphic province. The Peninsular Ranges province is generally characterized by a series of northwest trending mountain

---

<sup>3</sup> Conceptual plan titled "Mill Creek Dr. Apartments, Laguna Hills, CA" by Architects Orange dated 12 January 2023.

ranges and valleys. These topographic features are roughly parallel to the regional faults branching off of the San Andreas (e.g. Elsinore fault). Basement rock of the Peninsular Ranges is comprised of metamorphic rock with younger granitic intrusions.

Within the Peninsular Ranges, the site is located in the Santa Ana Mountains structural block. The Santa Ana block is bounded to the north and northeast by the Whittier and Elsinore fault zones and to the south and southwest by the Pacific Ocean. The site lies just northeast of the San Joaquin Hills and south of a broad alluvial fan complex associated with the Santa Ana River. The area is characterized by a series of relatively low, rolling hills primarily underlain by Tertiary-aged sedimentary bedrock.

Regional geologic mapping indicates that the subject site is mostly underlain by the Sespe formation, an Eocene to early Miocene (56 to 23 million years ago) continental conglomeratic unit (Morton and Miller, 2006) (Figure 2). The Sespe formation is generally comprised of massive to thickly bedded conglomerate, sandstone, and silty sandstone. The northeastern limits of the site are within a mapped Quaternary alluvial fan deposit. Regional mapping describes this unit as Holocene and late Pleistocene (present to about 130,000 years) alluvial fan deposits comprised of unconsolidated to moderately consolidated silt and sand with varying pebbles and cobbles.

## **3.2 Geologic Hazards Review**

Our geologic hazard review was performed in general accordance with CGS Special Publication 117A, "Guidelines for Evaluating and Mitigating Seismic Hazards in California," dated 2008. The following subsections present the results of our hazard review.

### 3.2.1 Regional Faulting

Recognized and mapped faults that are the highest percentage contributor to the ground motion parameter values for the site are obtained from the USGS Unified Hazard tool. From our review, the fault that contributes the highest percentage to the probabilistic ground motion is the San Joaquin Hills Fault, located approximately 3.5 miles (5.6 kilometers (km)) northeast of the site.

The Site is located in an active seismic area that has historically been affected by generally high to occasionally very high levels of ground motion. Therefore, the proposed development will probably experience high to occasionally very high levels of ground motion from nearby faults as well as ground motions from other active seismic areas of the southern California region. See Figures 3A and 3B for a map of regional faults and the map legend, respectively.

### 3.2.2 Regional Seismicity

A search of the web-based USGS Advanced National Seismic System (ANSS) Comprehensive Earthquake Catalog (ComCat), accessed on 5 April 2023, found that 30 earthquakes with magnitudes of 5.0 or greater have occurred within a 100-km radius of the site since 1900. See Figures 3A and 3B for a map of earthquakes and the map legend, respectively

### 3.2.3 Surface Rupture

Earthquake Fault Zones are regulatory zones delineated by the CGS around known, active faults with the potential to cause surface rupture. The zones average approximately ¼-mile in width. According to the CGS Earthquake Zones of Required Investigation Map, the site is not within a mapped Alquist-Priolo Special Study Zone or a Fault Rupture Study Area. See Figure 4 for a map showing the earthquake fault zones.

### 3.2.4 Historic High Groundwater

According to CGS Seismic Hazard Zone Report, San Juan Capistrano Quadrangle (2001), the reservoir adjacent to the site has a historical high groundwater at 10 feet below the existing ground surface (bgs). From the basemap that was provided See Figure 5.

### 3.2.5 Liquefaction

Liquefaction is a transformation of soil from a solid to a liquefied state during which saturated soil temporarily loses shear strength resulting from the buildup of excess pore water pressure, especially during earthquake-induced cyclic loading. Flow failure, lateral spreading, differential settlement, loss of bearing, ground fissures, and sand boils are evidence of excess pore pressure generation and liquefaction. Soil susceptible to liquefaction includes loose to medium-dense sands and gravels, low-plasticity silts, and some low-plasticity clay deposits below the groundwater table. According to CGS Earthquake Zones of Required Investigation, San Juan Capistrano Quadrangle (2001), the northeast section of the site borders a liquefaction hazard zone (Figure 4).

In our investigation, groundwater was not encountered within the maximum explored depth of approximately 31 feet. As discussed in Section 3.2.4, the recorded historic high groundwater data in the reservoir adjacent to the site is about 10 feet bgs. From the depth to historic high groundwater as well as the results of our investigation and engineering judgment, we preliminarily judge that a design groundwater elevation of el. 286 feet is appropriate. Subsurface

conditions below the design groundwater elevation are anticipated to consist of Sespe formation bedrock that is not susceptible to liquefaction. Therefore, we preliminarily conclude that the liquefaction potential at the site is low.

### 3.2.6 Landslides

The CGS Landslide Inventory Map and the CGS Earthquake Zones of Required Investigation, San Juan Capistrano Quadrangle (2001) map, indicates that a portion of the slope along the northern part the site is mapped within a potential earthquake-induced landslide zone (Figure 4). Please see Section 6.4.1 for conclusions from our preliminary landslide analyses.

### 3.2.7 Seismically-Induced Ground Deformations

Seismically-induced ground deformations include ground-surface settlement and differential settlement resulting from liquefaction-induced ground deformation and seismic densification of unsaturated sands and gravels from earthquakes. As discussed above, the site borders a liquefaction hazard zone and a portion of the site is mapped within an earthquake-induced landslide zone.

With the exception of the approximately 5½ feet of silty sand fill encountered in LB-3, the soil encountered above the groundwater table at the site generally consists of clayey or silty sandstone or stiff sandy clay to very dense clayey sand that are either cohesive and not subject to seismic densification or sufficiently dense to resist seismic densification. Therefore, we preliminarily conclude that the seismic densification potential at the site is low.

### 3.2.8 Lateral Spreading

Lateral spreading is a phenomenon in which surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. The surficial blocks are transported downslope or in the direction of a free face, such as a slope, by earthquake and gravitational forces. On the basis of the subsurface conditions encountered, we anticipate that the potential for liquefaction is low. Therefore, we also preliminarily judge that the potential for lateral spreading is low.

### 3.2.9 Flood Mapping

A review of the FEMA National Flood Hazard Layer, FIRM Panel 060590426J (2009) indicates that the northeast portion of the Site along the slope to the reservoir is located within Zone A, defined as a having a "1% Annual Chance Flood Hazard" without base flood elevation, and the

southwest portion of the Site is located within Zone X, defined as having a “0.2% Annual Chance Flood Hazard.” See Figure 6 for the FEMA Flood Hazard Map. The Project Civil engineer and architect should address the potential flood hazard as part of the site design.

#### 3.2.10 Tsunami, Seiche, and Dam Inundation

A tsunami is a long, high sea wave caused by an earthquake, submarine landslide, or other disturbances. According to CGS Information Warehouse: Tsunami Hazard Area Map, the site is not within a mapped tsunami inundation hazard zone and we therefore judge the potential for tsunami to be low.

A seiche is an oscillation of surface water in an enclosed or semi-enclosed basin such as a lake, bay, or harbor. As noted previously, the property is in close proximity to a large body of water (The Veeh Reservoir, which borders the site to the east). However, due to the height of the property above the reservoir, which is at least 45 feet, we anticipate that the risk for seiche to inundate the site is low.

A review of the California Department of Water Resources Division of Safety of Dams California Dam Breach Inundation Maps web-viewer indicates that the site is not located within an inundation zone from a dam breach.

#### 3.2.11 Subsidence

Land subsidence may be induced from withdrawal of oil, gas, or water from wells or from organic decomposition such as in a landfill or marsh area. According to a search on the CalGEM Well Finder online tool, no oil, gas, or geothermal wells are located within approximately 2½ miles of the site. Therefore, the site is not considered to be subject to land subsidence from oil, gas, or water withdrawal from oil wells. From our review of the site geology, the site is not on a former landfill or marsh area.

#### 3.2.12 Expansive Soils

Expansive soils occur when the moisture content in the soil causes swelling or shrinking as a result of cyclic wet/dry weather cycles, installation of irrigation systems, change in landscape plantings, or changes in grading. Swelling and shrinking soils can result in differential movement of structures including floor slabs and foundations, and site work including hardscape, utilities, and sidewalks. The 2022 CBC defines potentially expansive soils as soils with expansion indices (EI) greater than 20. EI testing was performed as part of our investigation, the results of which are discussed in a later section of this report.

### **3.3 Previous Geotechnical Investigations**

As part of our preliminary geotechnical investigation, we requested and reviewed available files for the site from the City of Laguna Hills archives. A geotechnical report for the prior development by EJM & Associates (EJM, 1986) as well as boring logs by Irvine Soils Engineering (ISE, 1994) were included with the data transmittal. Boring logs prepared by EJM and ISE are included in Appendix A.

From our review of cross sections prepared by EJM, we understand that the following grading was proposed as part of the development in the late 1980's

- the northern portion of the site was primarily cut, with cut depths of approximately 16 feet with shoulder fills up to approximately 12-feet-thick along the downhill slopes to Veeh Reservoir and Mill Creek Drive
- the central portion of the site was a combination of cuts up to 7 feet and fills up to approximately 6 feet
- the southern portion of the site was raised, with fills up to approximately 10 feet that were thickest along the top of the downhill slope to Veeh Reservoir.

According to the compaction reports prepared by EJM, the new fill for the office development was placed as engineered fills at a minimum of 90 percent of ASTM Test Method D1557. Ten-foot-wide keyways were excavated two feet into competent material (as determined by EJM's geotechnical engineer and engineering geologist) and benches were cut and prepared prior to the placement of fill.

### **3.4 Site History**

As part of our preliminary geotechnical investigation, we reviewed historic aerial photos for the site area dated 1938, 1946, 1952, 1963, 1967, 1972, 1980, 1981, 1985, 1987, 1988, 1992 to 2000, 2002 to 2005, 2009, 2010, 2012, 2014, 2016, 2018, and 2020. Pertinent information from these photos are summarized as follows:

- 1938: The site is undeveloped and occupied by a northwest – southeast trending ridge. The slope down to the reservoir appears generally devoid of vegetation. The area is otherwise undeveloped. Orchards are visible north and east of the reservoir.

1946-1967: The photo depicts similar conditions to the 1938 map. Some trees are visible on the slope to the reservoir. Orchards surround the site

1972: The southeastern tip of the ridge has been removed.

1980: The ridge has been removed. The orchards surrounding the site have been largely replaced by development.

1981-1985: These photos depict similar conditions to the 1980 map. The 1985 photo shows the 23282 and 23272 Mill Creek Drive buildings to the north of the Project HERE site have been constructed.

1987: Some grading of the pads for the 24411 and 23422 Mill Creek Drive buildings appears to have been completed. The slope down to the reservoir is still largely devoid of vegetation

1988: The 24411 and 23422 Mill Creek Drive buildings as well as the appurtenant site improvements along the southern half of the project site have been constructed. Building pads and foundations for the 23382 and 23332 Mill Creek Drive buildings are in progress.

1992: The current office buildings and site improvements have been completed. Vegetation is visible on the slope down to the reservoir.

1993-current: The photo shows conditions generally similar to the 1992 photo.

We also reviewed topographic maps for the site dated 1948 for 2022. The topographic map from 1948 indicates that the boundary of the Veeh Reservoir wraps around the southeastern tip of the ridge along what is now Ridge Route Drive.

## **4.0 SURFACE AND SUBSURFACE INVESTIGATION**

### **4.1 Langan's Subsurface Investigation**

Langan's subsurface investigation consisted drilling of six (6) borings, identified as LB-1 to LB-4, PT-1, and PT-2, to depths ranging from approximately 11½ to 31 feet bgs at the approximate locations shown on Figure 7, Site Plan. Percolation tests were performed in PT-1 and PT-2. Prior to performing our subsurface investigation, the borings were located in the field and DigAlert

was contacted to locate and mark public underground utilities at the Site. The borings were drilled on 16 March 2023 by Martini Drilling under the full-time engineering observation of a Langan field engineer.

In LB-1 through LB-4, samples were collected at 2½-foot-intervals within the upper 10 feet using a 3-inch-outer-diameter split barrel California sampler lined with 2.42-inch-inner-diameter brass rings. Below a depth of 10 feet, samples were collected with the California sampler or a 2-inch-outer-diameter standard penetration test (SPT) sampler. Soil samples were visually examined and classified in the field in accordance with the Unified Soil Classification System (USCS). Classifications were confirmed by re-examination at the laboratory. Representative samples were selected for testing. Details regarding the subsurface materials encountered are presented in the boring logs included in Appendix B.

In addition to our subsurface investigation, we also conducted a separate site visit to observe surficial slope conditions. Due to heavy vegetation covering the northerly descending slope toward Veeh Reservoir, site observations for geologic contacts or surficial sliding could not be readily obtained. However, we observed no apparent indicators of existing landslides based on aerial imagery, or field proxies, such as zones of dead vegetation - which can be an indicator of slope movement. Slope stability considerations are discussed further in Section 6.4.1.

#### **4.2 Percolation Testing**

Two (2) percolation tests were performed at depths of approximately 10 feet bgs; one in boring PT-1 and another boring PT-2. The percolation tests were performed in general accordance with the methods presented in the Orange County Technical Guidance Document for the Preparation of Conceptual/Preliminary and/or Water Quality Management Plans (2013). Percolation test results are included in Appendix C.

#### **4.3 Laboratory Testing**

The geotechnical laboratory testing was performed by GeoLogic Associates and included the following tests:

- Moisture Content – ASTM D2216
- Atterberg Limits – ASTM D4318
- Sieve Analysis – ASTM C136
- Direct Shear – ASTM D3080

- Expansion Index – ASTM D4829
- R-Value – ASTM D2844/CTM 301
- Electrical Resistivity – CTM 643
- Sulfate Content – CTM 417
- Chloride Content – CTM 422
- Soil pH – CTM 643

The laboratory test results are included in Appendix D.

## 5.0 SUBSURFACE CONDITIONS

In general, subsurface conditions below the Site generally consist of shallow bedrock of the Sespe formation (Ts) overlain by up to 17 feet of soil consisting of either fill or native, residual soil. Our interpretation of the subsurface conditions based in the available boring logs (EJN & Associates, Irvine Soils Engineering, and Langan) is summarized below.

- **Fill** – As noted above, between 5½ and 13 feet of fill is currently present below portions of the site and was encountered in borings LB-3, LB-4, PT-1, and PT-2. ISE noted the presence of between 8 and 17 feet of fill during their exploration, which occurred after the grading for the existing development. The fill is generally comprised of silty to clayey sand or silt or stiff to very stiff sandy clay. Direct shear laboratory test results on a sample of the fill collected during the current investigation indicates the sandy clay fill has a friction angle of about 30.5 degrees and a cohesion of 150 pounds per square foot (psf).
- **Native soil** – EJN borings 1, 2, 4, 5, and 7 to 9 encountered between 1½ and more than 10 feet of native soil comprised of clay with varying amounts of sand and silt or sand with varying amounts of clay. The native soil encountered in EJN borings 1 and 2 was likely removed as part of the grading for the existing development. The native soil encountered in EJN borings 4, 5, and 7 to 9 likely remained in place as part of grading for the existing development. Langan boring LB-4 encountered approximately three feet of native (residual) soil comprised of stiff sandy clay.
- **Sespe formation (Ts)** – Sespe formation bedrock is present throughout the site. The bedrock consists of red to tannish brown, non-marine clayey to silty sandstone that extends to the maximum explored depth of approximately 31 feet bgs. A corrosion test was performed on bag sample of the Sespe formation collected from boring LB-2.

An expansion index test (EI) performed on bag sample of the Sespe formation collected from boring PT-1 indicates that the material has medium expansion potential, with an expansion index of 57. Direct shear laboratory test results on ring samples of the bedrock indicate the material has ultimate friction angles of about 28.5 to 31 degrees with cohesion of 100 to 200 psf. Laboratory test results are included in Appendix B.

- **Groundwater** – Groundwater was not encountered within the maximum explored depth of about 31 feet.

## 6.0 SEISMIC EVALUATION AND GEOTECHNICAL RECOMMENDATIONS

### 6.1 Seismic Design Parameters

On the basis of our evaluation of the subsurface conditions at the site, we preliminarily conclude that the site may be characterized as Seismic Site Class D, in accordance with Chapter 20 of ASCE 7-16. As such, the following preliminary seismic design criteria may be used.

| Type     | Value | Description   |
|----------|-------|---|
| $S_S$    | 1.222 | $MCE_R$ mapped spectral response acceleration at short period               |
| $S_1$    | 0.439 | $MCE_R$ mapped spectral response acceleration at one-second period          |
| $F_a$    | 1.011 | Site Amplification Factor at 0.2 second                                     |
| $F_v$    | 2.79  | Site Amplification Factor at 1.0 second                                     |
| $S_{MS}$ | 1.236 | Site-modified spectral acceleration at short period                         |
| $S_{M1}$ | 1.225 | Site-modified spectral acceleration at one-second period                    |
| $S_{DS}$ | 0.824 | Design earthquake spectral response acceleration at short period            |
| $S_{D1}$ | 0.817 | Design earthquake spectral response acceleration at one-second period       |
| $PGA_M$  | 0.565 | MCE geometric mean peak ground acceleration adjusted for site class effects |

#### Notes:

1. Values based on Site Class D
2. Values of  $F_v$ ,  $S_{M1}$ , and  $S_{D1}$  assume the exceptions of ASCE 7-16 Section 11.4.8 are met and have been increased by 50 percent per Supplement 3 of ASCE 7-16.
3. MCE = Maximum Considered Earthquake
4.  $MCE_R$  = Risked-Targeted Maximum Considered Earthquake

The recommended mapped values of  $F_v$ ,  $S_{M1}$ , and  $S_{D1}$  for Site Class D have been increased by 50 percent in accordance with the exception of Section 11.4.8.1 of Supplement No. 3 to ASCE 7-16. If the structural engineer elects not to use this exception in the seismic design approach, we should be notified so that we may develop site-specific response spectra and seismic design criteria in accordance with Chapter 21 of ASCE 7-16.

The design-level geotechnical investigation should include additional subsurface exploration of the site to better understand the subsurface conditions to establish it is appropriate to classify a portion of the site as Site Class C.

## **6.2 Flood Design**

As discussed in Section 3.2.9, a portion of the proposed development is within the FEMA Zone A, defined as a having a "1% Annual Chance Flood Hazard" with base flood elevation or depth not determined. The civil engineer should confirm that the site grades consider the base flood elevation and any required freeboard.

## **6.3 Groundwater Considerations**

As discussed in Section 5.0, groundwater was not encountered within the maximum explored depth of approximately 31 feet during our subsurface investigation. The recorded historic high groundwater noted during our records research data from the site vicinity is about 10 feet bgs. However, we judge that the mapped depth to historic high groundwater likely applies to the reservoir and not to the Project HERE site. Our preliminary geotechnical evaluation did not encounter groundwater above approximately el. 297 feet and the topographic plan provided by Fuscoe indicates that the water level in Veeh Reservoir is approximately el. 283 feet. On the basis of the data from the preliminary geotechnical evaluation and the water level in the reservoir, we judge that a design groundwater elevation of el. 286 feet is appropriate for design.

Some seepage through the Sespe formation bedrock or between the top of bedrock and soil should be anticipated.

## **6.4 Seismic and Geologic Hazards**

During a major earthquake, high to very high ground shaking is expected to occur at the project site. Ground shaking during an earthquake can result in ground failure such as that associated

with soil liquefaction<sup>4</sup> and cyclic softening<sup>5</sup>, lateral spreading,<sup>6</sup> seismic densification<sup>7</sup>, and fault rupture. Each of these conditions has been evaluated based on our literature review, field investigation and analysis, and are discussed in Section 3.2 or in this section.

On the basis of the deaggregation of the probabilistic seismic hazard spectrum from the USGS Unified Hazard Tool, the mean and mode earthquakes for the 2 percent probability of exceedance in 50 years (2,475-year return period) event are 6.71 and 6.89 moment magnitudes, respectively.

#### 6.4.1 Slope Stability

Based on review of historic aerials from 1938 through 2020, there is no apparent history of landsliding onsite. Based on limited site observations above existing slopes, there is no apparent evidence of slope instability.

Records provided by the City of Laguna Hills indicate slope stability analysis for portions of the northerly descending slope was performed by EJM and Associates in March and May of 1986 in support of the existing development and they concluded that the slope is generally stable.

Since the time of their investigation, updated regulations and standard of practice regarding slope stability and analysis have become more conservative, including analysis for earthquake induced landsliding, often referred to as a pseudostatic analysis. A quantitative analysis of the slope stability under static and pseudostatic conditions for the downhill slope into Veeh Reservoir should be performed as part of a design-level geotechnical investigation.

### **6.5 Preliminary Foundation Evaluation and Recommendations**

From a geotechnical standpoint, the proposed site development is considered feasible provided the site conditions and geotechnical issues in this report are properly addressed during the design

---

<sup>4</sup> Liquefaction is a transformation of soil from a solid to a liquefied state during which saturated soil temporarily loses strength resulting from the buildup of excess pore water pressure, especially during earthquake-induced cyclic loading. Soil susceptible to liquefaction includes loose to medium dense sand and gravel, low-plasticity silt, and some low-plasticity clay deposits.

<sup>5</sup> Cyclic softening is a phenomenon in which soil loses strength resulting from the buildup of excess pore water pressure, especially during earthquake-induced loading, but has sufficient internal cohesion to resist complete liquefaction.

<sup>6</sup> Lateral spreading is a phenomenon in which surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. Upon reaching mobilization, the surficial blocks are transported downslope or in the direction of a free face by earthquake and gravitational forces.

<sup>7</sup> Seismic densification is a phenomenon in which non-saturated, cohesionless soil is densified by earthquake vibrations, causing ground-surface settlement.

and construction of the proposed improvements. However, additional subsurface information should be gathered during a design-level geotechnical investigation to better characterize the quality, depth, and lateral extents of the fill.

From our preliminary discussions with Fuscoe Engineering, we understand that the grades for the proposed development will be at, or near, existing grades, with the exception of the north portion of Block 4 and the paseo/fire access lane, where up to 45 feet fill could be required. If confirmed, we will need to provide supplemental recommendations during final once grading plans are available.

On the basis of our evaluation of the subsurface data and our understanding of the proposed development, foundations are expected to be underlain by Sespe formation, fill, or native soil, which is generally suitable for support of the structure. From our review of the subsurface information as well as our geotechnical exploration, we anticipate the proposed structures can be supported on shallow foundations such as spread footings or a mat foundation. Additional foundation information is provided below.

#### 6.5.1 Shallow Foundations

- **Spread Footings or Continuous Footings:** A preliminary bearing value of 2,500 to 4,500 psf may be used for continuous and isolated footings bearing a minimum depth of 24 inches below the lowest adjacent grade and having a minimum width of 12 inches. Transition cut/fill building areas with shallow fill (less than 5 feet thick) should be overexcavated to a minimum depth of 5 feet in order to provide a uniform fill blanket for foundation support. In addition, building footprints underlain by rock should be overexcavated a minimum depth of 5 feet.

Footings nearest the top of the downhill slope to the Veeh Reservoir can be deepened based on the recommendation provided in Section 6.13. Recommended allowable bearing values include both dead and live loads and may be increased by one-third for wind and seismic forces. The parking structures could require partial mat foundations under shear walls to reduce the bearing pressures to the recommended allowable values. Recommendations for mat foundations are provided in Section 6.5.2.

Footing static settlement of approximately one inch and differential settlements of up to ½-inch over 50 feet are anticipated with foundations bearing on appropriately prepared engineered fills. Seismically-induced settlements are not anticipated based on the available subsurface data.

Footing excavations should be performed using a backhoe bucket fitted with a smooth steel plate welded across the bucket teeth to minimize disturbance during excavation and to provide a smooth bearing surface.

The footing subgrades should be firm and unyielding, inspected and approved by a qualified geotechnical engineer prior to steel or concrete placement.

Foundations should be constructed as soon as possible following subgrade approval. The contractor shall be responsible for maintaining the subgrade in its as approved condition (i.e. free of water, debris, etc.) until the footing is constructed.

- **Lateral Resistance:** Lateral loads on footings bearing on appropriately prepared engineered fills or bedrock can be resisted by a combination of passive resistance acting against the vertical faces of the footings and friction along the bases of the footings. We recommend a passive resistance be calculated using a lateral pressure corresponding to an equivalent fluid pressure of 250 pounds per cubic foot (pcf); the upper foot of soil should be ignored unless confined by a concrete slab or pavement. Frictional resistance should be computed using a base friction coefficient of 0.25. The passive resistance and base friction values include a factor of safety of about 1.5 and can be used to resist total loads (including wind and/or seismic loads). They may be used in combination without reduction.

## 6.6 Slabs-on-Grade

The building pads could span transitions between fill and bedrock at the exposed subgrade (pad) level. Even if the fill is compacted based on the recommendations provided in Section 7.2, we anticipate that the compressibility of the fill will differ from the compressibility of bedrock. Therefore, we recommend that the slab on grade be cast over a minimum of 5 feet of new material, which could consist of 56 inches of engineered fill and a four-inch-thick capillary moisture break layer below the floor slab. If the pad subgrade is disturbed during excavation for footings and utilities, it should be re-rolled. Loose, disturbed materials should be excavated, removed, and replaced with engineered fill during final subgrade preparation.

Steel reinforcing and concrete thickness should be designed by the project Structural Engineer for soils with a medium expansion potential ( $50 < EI < 90$ ). We recommend, at a minimum, using the following recommendations:

- subgrade modulus,  $K$ , equal to 120 pounds per cubic inch (pci); and
- 4-inch minimum thickness.

For moisture-sensitive floor areas, a moisture barrier, consisting of a 15-mil polyethylene water vapor retarder over a minimum of four inches of capillary break as required by 2022 CBC Section 1805.4.1, shall be placed between the base course and concrete floor slab. The water vapor retarder should meet the requirements for Class C vapor retarders stated in ASTM E1745 and should be placed in accordance with the requirements of ASTM E1643. The capillary break should consist of open-graded, free draining, virgin material with a gradation that meets the requirements of the 2022 CBC.

## 6.7 Lateral Earth Pressure

Although grading plans were not available at the time of preparation of this preliminary evaluation, we recommend that any proposed retaining walls be designed to resist soil and surcharge pressures using the parameters below. The project should include the replacement of the crib wall along a portion of the northwest perimeter of the site.

- Ultimate Coefficient of Friction = 0.35
- Soil Unit Weight = 130 pounds per cubic foot (pcf)
- Friction Angle = 28.5 degrees
- Equivalent Fluid Pressure (At-Rest Condition / Restrained Wall): Drained and Above Design Groundwater Level = 70 psf/foot
- Equivalent Fluid Pressure (Active Condition / Unrestrained Wall): Drained and Above Design Groundwater Level = 45 psf/foot
- Hydrostatic Equivalent Fluid Pressure = 62.4 psf/foot
- The design of any retaining walls greater than six feet in height should consider the additional earth pressures caused by seismic ground shaking. The seismic force increment is estimated based on the design earthquake and may be considered to act as a triangular distribution pressure equal to 30 psf/foot. The seismic increment should be added to the active (unrestrained) lateral earth pressures when considered for below grade walls.
- At-rest, active, passive, and seismic thrust increment should be considered to follow a triangular distribution.
- Lateral loads from surcharges on retaining walls may be considered to impart surcharges to the restrained walls using an earth pressure coefficient of  $\frac{1}{2}$  for restrained walls presuming a uniform distribution. Surcharge loading from adjacent structures should be considered where the adjacent foundations are supported on the soil above a 1H:1V theoretical influence line projected upwards from the base of the retaining wall.

- Surcharge loading should consider adjacent streets, vehicular traffic, and sidewalks. Where vehicular traffic will pass within 10 feet of retaining walls, temporary traffic loads should be considered in the design of walls. Traffic loads such as fire trucks or cars parked on the street beyond the sidewalk may be modeled by a minimum uniform pressure of 100 psf/foot applied on the upper 10 feet of the walls.
- A wall drainage system, such as uniformly spaced prefabricated drainage panels connected to a toe drain, should be installed behind retaining grade walls to reduce the potential for hydrostatic pressure build up. The toe drain should be sloped to drain into an appropriate outlet. The design of the retaining walls should include the hydrostatic equivalent fluid pressure if they will not be drained.

## 6.8 Preliminary Pavement Sections

On the basis of the soil conditions present at the Site and estimated traffic volume, preliminary pavement sections are provided in the following table. We selected an R-value of 7 for preliminary design based on the lab test results.

The sections provided herein are for planning purposes only and should be re-evaluated subsequent to site grading. Final pavement sections should be based on actual R-value testing of in-place soils and analysis of anticipated traffic. Preliminary flexible pavement sections for parking areas have been developed with the parameters summarized on the following table.

| Pavement Area                        | Traffic Index | Section Thickness |                        |
|--------------------------------------|---------------|-------------------|------------------------|
|                                      |               | Asphalt Concrete  | Class 2 Aggregate Base |
| Parking Areas with Occasional Trucks | 4.0           | 4 inches          | 6 inches               |
| Driveways and Truck-Use Areas        | 6.0           | 4 inches          | 12 inches              |

Aggregate base materials should be Crushed Aggregate Base or Crushed Miscellaneous Base conforming to Section 200-2 of the Standard Specification for Public Works Construction (Greenbook) or Class 2 Aggregate Base conforming to the Caltrans' Standard Specifications. The materials should be moisture conditioned to slightly over the optimum moisture content then compacted to at least 95 percent of ASTM Test Method D1557, latest edition.

Prior to placement of pavement elements, the upper two feet of subgrade soils should be moisture-conditioned to within 2 percent of the optimum moisture content then compacted to at

least 95 percent of the laboratory determined maximum dry density. Areas observed to pump or yield under vehicle traffic should be removed and replaced with firm and unyielding compacted soil or aggregate base materials.

Non-vehicular concrete pavements (including exterior slabs and hardscape) should have a nominal thickness of at least 4 inches and be supported on compacted subgrade and at least 6 inches of Class 2 Aggregate Base compacted to at least 90 percent relative compaction. Cold joints or saw cuts in the concrete should be provided at least every 15 feet in each direction.

## 6.9 Corrosion Considerations

Chemical analyses performed on the near-surface soil are summarized in the following table. A copy of the corrosion test results is provided in Appendix D.

| Soil Type                      | Boring ID | Resistivity (ohm-cm) | pH  | Sulfate (ppm) | Chloride (ppm) |
|--------------------------------|-----------|----------------------|-----|---------------|----------------|
| Clayey Sandstone (0 to 5 feet) | LB-2      | 6,200                | 7.5 | 106           | 9              |

A corrosion expert should be consulted during the design phase for the most economical and effective corrosion protection if ferrous site utilities are required. On the basis of the soluble sulfate percent, concrete can be designed as exposure class S0 for sulfate exposure. Per ACI 318-A, no special recommendation for cement, but a minimum specified compressive strength ( $f'c$ ) of 2,500 pounds per square inch (psi) may be used for foundation element and slabs (ASTM C150).

## 6.10 Site Infiltration

The infiltration rate of the soils at the locations tested is summarized in the table below. The percolation tests suggest the soil at tested locations were not permeable. When final drywell or infiltration structure locations are confirmed, supplemental testing may be required to meet North Orange County Percolation Test Requirements. Percolation Test results are included in Appendix C.

| Boring ID | Test Depth (feet) | Soil Type | Infiltration Rate (inches/hour) |
|-----------|-------------------|-----------|---------------------------------|
| PT-1      | 10                | CL        | 0.0                             |
| PT-2      | 10                | SM        | 0.2                             |

All proposed storm water infiltration systems should be located at least 50 feet away from any settlement sensitive structures and the downhill slope to Veeh Reservoir. If the storm water infiltration systems need to be located less than five feet from the edge of the new foundations, we recommend footings adjacent to storm water infiltration systems bear below an imaginary 1.5:1 (horizontal to vertical) plane projected upward from the bottom edge of the storm water infiltration system areas. In addition, the passive resistance against the vertical face of the footing should be ignored. The structural engineer will need to confirm that this is acceptable to their foundation design.

### **6.11 California Building Code Required Slope Setbacks**

For buildings on top of a slope, the Orange County Grading Manual requires building foundations be set back a minimum horizontal distance of  $H/3$ , where  $H$  is the height of the slope, but no more than 40 feet. For this Site, the adjacent slopes (estimated from top of slope to the waterline of the reservoir) vary between approximately 45 and 60 feet tall, so we anticipate that a minimum setback of 15 to 20 feet will be required. Alternatively, the foundations can be deepened such that the horizontal distance between the foundation and the face of the slope (distance to daylight) meets the setback requirement. We note that the estimated setback does not account for the height of the slope below the water line of Veeh Reservoir as shown in the topographic plan provided by Fuscoe.

## **7.0 CONSTRUCTION CONSIDERATIONS**

### **7.1 Site Preparation and Grading**

Prior to the commencement of mass excavation and grading, a meeting should be held at the Site with the owner, city inspector, excavation/grading contractor, civil engineer, and geotechnical consultant to discuss the work schedule and geotechnical aspects of the grading.

All vegetation and deleterious materials should be disposed of off-site prior to initiation of grading operations.

All surficial units consisting of any soil with roots or loose surficial soil are considered unsuitable for support of the proposed improvements. These materials should be over-excavated to expose competent soils. These over-excavated soils, free of deleterious materials and approved by the geotechnical engineer, may be reused as compacted fill. These surficial soil materials are anticipated to be relatively easy to excavate with conventional heavy earthmoving equipment.

Zones of harder bedrock should be anticipated during site preparation. Most of these materials are below optimum moisture content and will require the addition of water to achieve proper compaction.

The geotechnical consultant should be provided with appropriate survey staking during grading to verify that depths and locations of recommended over-excavations have been achieved. Observations of over-excavations should be performed by the geotechnical engineer to verify the anticipated conditions. All excavations should conform to the requirements of CAL/OSHA.

All over-excavation bottoms should be observed by the geotechnical engineer prior to fill placement. Prior to placement of fill material, the over-excavation bottom should be scarified to a depth of at least six inches, moisture conditioned to above optimum moisture content, and proof-rolled.

Any foundation remnants or construction debris encountered within excavations should be fully removed, and any void spaces that may be created should be backfilled with approved compacted structural fill. Private sewage systems, if encountered during grading should be properly removed or abandoned in place in accordance with local codes. If septic systems or seepage pits are encountered, and they are abandoned in-place, they should be pumped clean, backfilled with gravel or clean sand and capped with a minimum of two feet of 2-sack slurry. The top of the slurry cap should be at 5 feet below proposed grade.

Any environmentally unsuitable soils encountered during the excavation process should be properly disposed of off-site in accordance with all state and local regulations.

If removals are limited by existing improvements or property lines, special grading techniques, such as slot cuttings or other acceptable construction methods may be required. Under such conditions, specific recommendations should be provided by the geotechnical consultant during review of final grading plan.

## **7.2 Fill Material and Compaction Criteria**

Fill material (imported or re-used) should be free of organic, and other deleterious materials and have a maximum particle size no greater than 3 inches. Imported fill should contain no more than 12 percent passing the no. 200 sieve by dry weight and have a plasticity index less than 7. Grain-size distributions, Atterberg Limits, maximum dry density, and optimum water content determinations should be made on representative samples of the proposed fill material.

Engineered fill below building foundations and behind retaining walls should be placed in uniform lifts (maximum 8-inches thick) and compacted to at least 95 percent of its maximum dry density at a moisture content above optimum moisture content, as determined by ASTM D1557.

All fill placed below non-vehicular flatwork should be compacted to a minimum of 90 percent of its maximum dry density at a moisture content above optimum moisture content, as determined by ASTM D1557. All fill placed below vehicular pavement or fill thicker than five feet should be compacted to a minimum of 95 percent of its maximum dry density at a moisture content above optimum moisture content, as determined by ASTM D1557. Fill placement should be subject to controlled full-time engineering observation and testing by the geotechnical engineer. Fill material should not be placed in areas where free water is standing or on surfaces which have not been approved by the geotechnical engineer.

Preliminarily, keyways and benches should be anticipated below the fill slopes that will support the north end of Building 4 and the paseo/fire access lane.

### **7.3 Site Drainage**

Proper drainage should be maintained at all times. Ponding or trapping of water in localized areas can cause differing moisture levels in the subsurface soil. Drainage should be directed away from the tops of slopes and excavations. Erosion protection and drainage control measures should be implemented during periods of inclement weather. During rainfall events, backfill operations may need to be restricted to allow for proper moisture control during fill placement.

Although groundwater was not encountered during explorations performed for this study, shallow perched water may be encountered at the Site depending on seasonal rainfall. The Site should be graded to ensure positive drainage away from the locations of the proposed development.

### **8.0 FUTURE STUDIES AND DESIGN AND CONSTRUCTION PHASE SERVICES**

The conclusions and preliminary recommendation provide herein are based on project information provided to date and a limited number of borings. As part of schematic design, a design-level geotechnical investigation and evaluation should be provided when structural loads are available. The design-level geotechnical investigation should include additional exploratory borings that extend below the proposed foundation level to confirm the subsurface conditions.

During final design we should be retained to consult with the design team as geotechnical questions arise. Technical specifications and design drawings should incorporate Langan's recommendations. When authorized, Langan will assist the design team in preparing specification sections related to geotechnical issues such as earthwork, shallow foundations, backfill and excavation support. Langan should also, when authorized, review the project plans, as well as Contractor submittals relating to materials and construction procedures for geotechnical work, to confirm the designs incorporate the intent of our recommendations.

Langan has investigated and interpreted the site subsurface conditions and developed the foundation design recommendations contained herein, and is therefore best suited to perform quality assurance observation and testing of geotechnical-related work during construction. The work requiring quality assurance confirmation and/or special inspections per the Building Code includes, but is not limited to, earthwork, backfill, shallow foundations, and excavation support.

Recognizing that construction observation is the final stage of geotechnical design, quality assurance observation during construction by Langan is necessary to confirm the design assumptions and design elements, to maintain our continuity of responsibility on this project, and allow us to make changes to our recommendations, as necessary. The foundation system and general geotechnical construction methods recommended herein are predicated upon Langan assisting with the final design and providing construction observation services for the Owner. Should Langan not be retained for these services, we cannot assume the role of geotechnical engineer of record, and the entity providing the final design and construction observation services must serve as the engineer of record.

## **9.0 OWNER AND CONTRACTOR RESPONSIBILITIES**

The Contractor is responsible for construction quality control, which includes satisfactorily constructing the foundation system and any associated temporary works to achieve the design intent while not adversely impacting or causing loss of support to neighboring structures. Construction activities that can alter the existing ground conditions such as excavation, fill placement, foundation construction, ground improvement, etc. can also potentially induce stresses, vibrations, and movements in nearby structures and utilities, and disturb occupants of nearby structures. Contractors working at the Site must ensure that their activities will not adversely affect the performance of the structures and utilities, and will not disturb occupants of nearby structures. Contractors must also take all necessary measures to protect the existing structures during construction. By using this report, contractors agree that Langan will not be held responsible for any damage to adjacent structures.

## **10.0 LIMITATIONS**

The conclusions and recommendations provided in this report result from our interpretation of the geotechnical conditions existing at the Site inferred from a limited number of borings. Recommendations provided are contingent upon one another and no recommendation should be followed independent of the others.

Any proposed changes in structures or their locations should be brought to Langan's attention as soon as possible so that we can determine whether such changes affect our recommendations. Information on subsurface strata shown on the logs represents conditions encountered only at the locations indicated and at the time of investigation. If different conditions are encountered during construction, they should immediately be brought to Langan's attention for evaluation, as they may affect our recommendations.

This report has been prepared to assist the owner in their site selection process and is only applicable to the design of the specific project identified. The information in this report cannot be utilized or depended on by engineers or contractors who are involved in evaluations or designs of facilities (including underpinning, grouting, stabilization, etc.) on adjacent properties which are beyond the limits of that which is the specific subject of this report.

Environmental issues (such as permitting or potentially contaminated soil and groundwater) are outside the scope of this study and should be addressed in a separate evaluation.

**LEGEND:**

 Site Location

**Fault Age**

-  Historic
-  Holocene
-  Late Quaternary
-  Early Quaternary
-  Pre-Quaternary Fault
-  100 km Search Radius

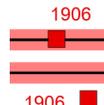

**Earthquake Epicenter**

-  Magnitude 5.0 to 5.9
-  Magnitude 6.0 to 6.9
-  Magnitude 7.0 to 7.4
-  Magnitude 7.5 to 8.0

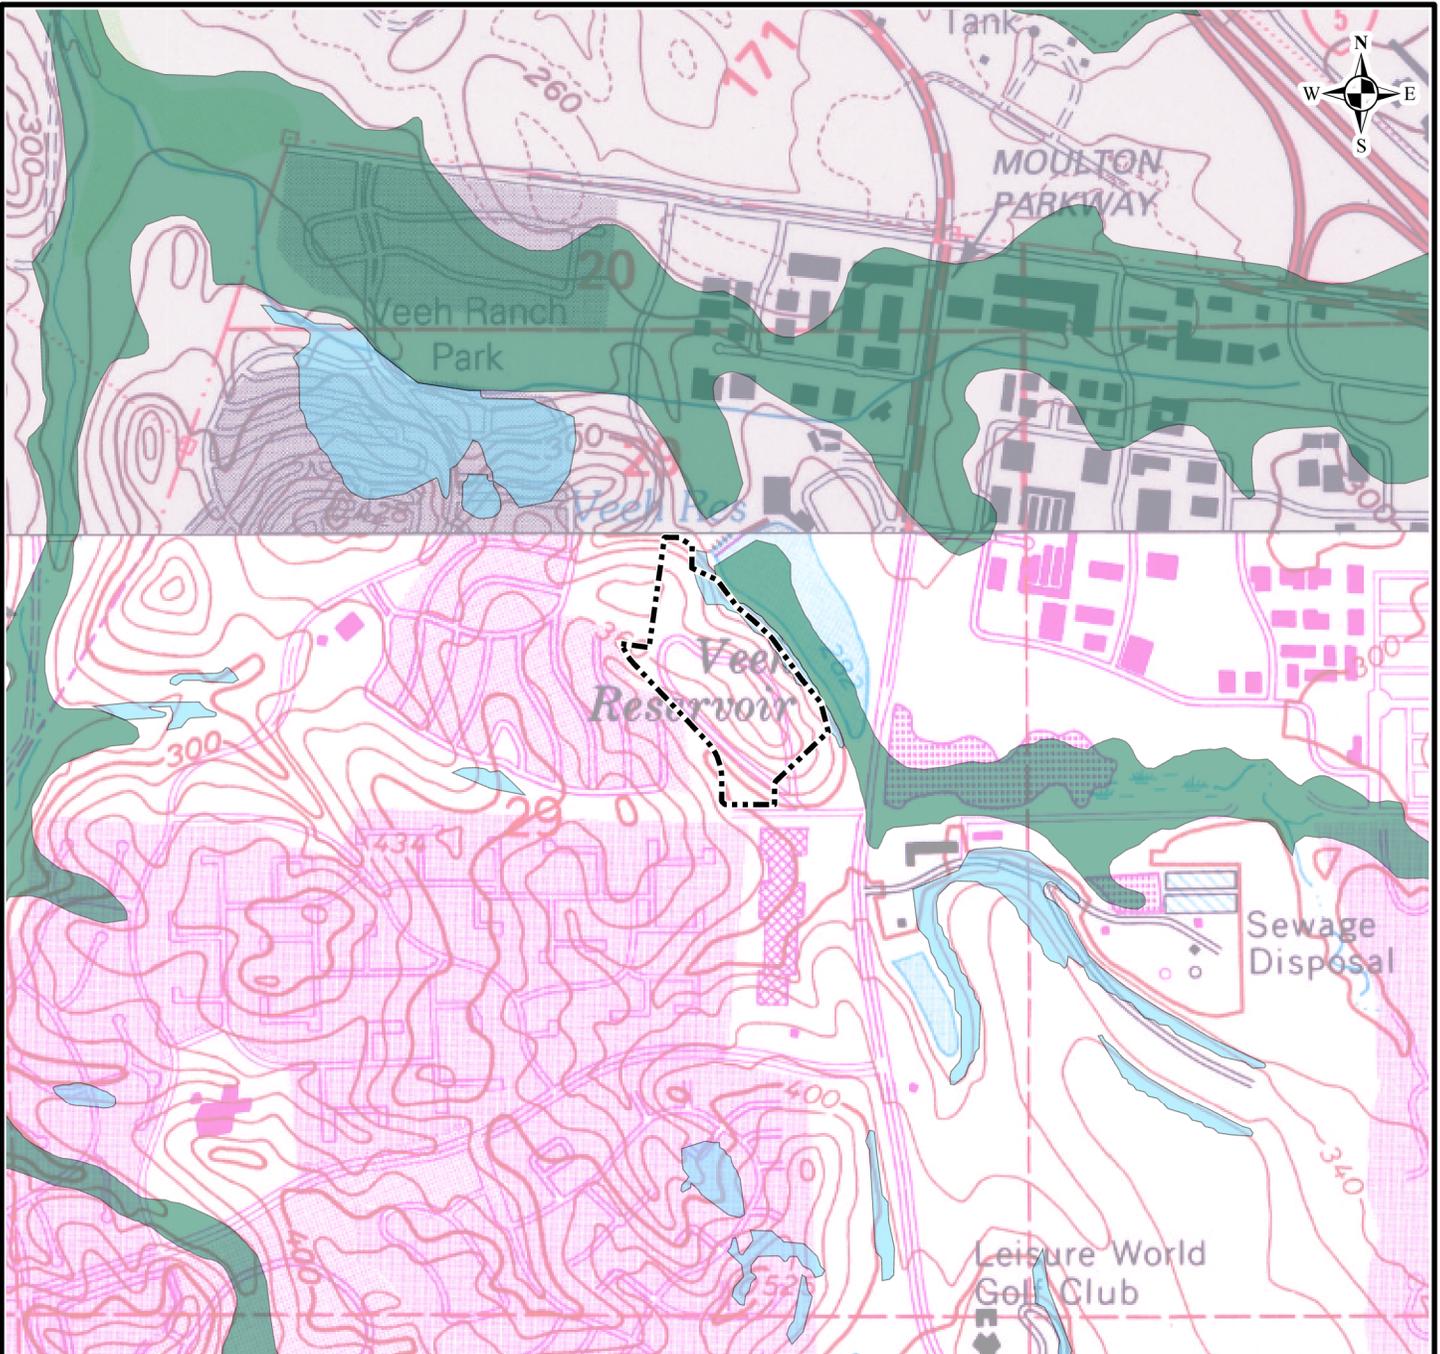

**Fault Symbols**

-  Bar and ball on downthrown side (relative or apparent).
-  Relative or apparent direction of lateral movement.
-  Direction of dip.
-  Low angle fault (barbs on upper plate). Fault surface generally dips less than 45° but locally may have been subsequently steepened.
-  Numbers refer to annotations listed in the appendices of the accompanying report.
-  Structural discontinuity (offshore) separating differing Neogene structural domains.
-  Brawley Seismic Zone.

**Fault Classification**

-  Fault along which historic (last 200 years) displacement has occurred and is associated with one or more of the following:
  - (a) a recorded earthquake with surface rupture. (Also included are some well-defined surface breaks caused by ground shaking during earthquakes, e.g. extensive ground breakage, not on the White Wolf fault, caused by the Arvin-Tehachapi earthquake of 1952). The date of the associated earthquake is indicated. Where repeated surface ruptures on the same fault have occurred, only the date of the latest movement may be indicated, especially if earlier reports are not well documented as to location of ground breaks.
  - (b) fault creep slippage - slow ground displacement usually without accompanying earthquakes.
  - (c) displaced survey lines.
-  A triangle to the right or left of the date indicates termination point of observed surface displacement. Solid red triangle indicates known location of rupture termination point. Open black triangle indicates uncertain or estimated location of rupture termination point.
-  Date bracketed by triangles indicates local fault break.
-  No triangle by date indicates an intermediate point along fault break.
-  Fault that exhibits fault creep slippage. Hachures indicate linear extent of fault creep. Annotation (creep with leader) indicates representative locations where fault creep has been observed and recorded.
-  Square on fault indicates where fault creep slippage has occurred that has been triggered by an earthquake on some other fault. Date of causative earthquake indicated. Squares to right and left of date indicate terminal points between which triggered creep slippage has occurred (creep either continuous or intermittent between these end points).

| Major Divisions   |  |   | Group Symbols   | Soil Description   |  |
|---|--|---|---|--|--|
| <b>COARSE GRAINED SOIL</b><br>(More than 50% material larger than the #200 sieve) | <b>GRAVEL</b><br>(More than 50% material larger than #4 sieve)                   | <b>Clean GRAVEL</b><br>(Less than 5% fines)                           | <b>GW</b>   | Well graded gravels, gravel-sand mixtures, little or no fines.     |  |
|   |  | <b>GRAVEL</b><br><b>With Fines</b><br>(More than 12% fines)           | <b>GP</b>   | Poorly graded gravels or gravel-sand mixtures, little or no fines. |  |
|   |  | <b>SAND</b><br>(More than 50% material smaller than #4 sieve)         | <b>Clean SAND</b><br>(Less than 5% fines)                         | <b>GM</b>  | Silty gravels, gravel-sand-silt mixtures, non-plastic fines. |
|   |  |   | <b>SAND</b><br><b>With Fines</b><br>(More than 12% fines)         | <b>GC</b>  | Clayey gravels, gravel-sand-clay mixtures, plastic fines.    |
|   | <b>FINE GRAINED SOIL</b><br>(More than 50% material smaller than the #200 sieve) | <b>SILT &amp; CLAY</b><br>(Liquid limit less than 50)                 | <b>SW</b>   | Well graded sands, gravelly sands, little or no fines.             |  |
|   |  |   | <b>SP</b>   | Poorly graded sands or gravelly sands, little or no fines.         |  |
|   |  |   | <b>SM</b>   | Silty sands, sand-silt mixtures, non-plastic fines.                |  |
|   |  | <b>SILT &amp; CLAY</b><br>(Liquid limit more than 50)                 | <b>SC</b>   | Clayey sands, sand-clay mixtures, plastic fines.                   |  |
| <b>ML</b>   |  |   | Inorganic silts, sandy or clayey silts<br>Low to no plasticity.   |  |  |
| <b>CL</b>   |  |   | Inorganic clay, sandy or silty clay.<br>Low to medium plasticity. |  |  |
| <b>SILT &amp; CLAY</b><br>(Liquid limit more than 50)                             | <b>OL</b>  | Organic silt or organic silty clay.<br>Low to medium plasticity.      |   |  |  |
|   | <b>MH</b>  | Inorganic silts, diatomaceous or micaceous fine sandy or silty soils. |   |  |  |
|   | <b>CH</b>  | Inorganic clays of high plasticity,<br>Fat clays.                     |   |  |  |
| <b>OH</b>   | <b>DH</b>  | Organic clays of medium to high plasticity, organic silts.            |   |  |  |
|   | <b>PT</b>  | Peat and other highly organic soils.                                  |   |  |  |
| <b>HIGHLY ORGANIC SOIL</b>  |  |   | <b>PT</b>   | Peat and other highly organic soils.                               |  |

| Comments:                   |           | 1. Percolation test was performed in accordance with the Orange County - Technical Guidance Document dated 28 September 2017.<br>2. Infiltration Rate was calculated using Porchet Method.<br>3. Per the procedures for shallow percolation tests in non-sandy soils, a minimum of twelve measurements were taken in 30-minute intervals for six hours after sandy soil criteria was not met.<br>4. Weather: Cloudy, 62°F<br>5. Measurements were collected from the Top of PVC Pipe |                               |                     |                             |                     |                              |                           |                           |

# PT-1

1. Percolation test PT-1 was performed approximately 10 feet below existing grade.
2. Refer to Figure 1 for percolation test location.
